1.0 INTRODUCTION

In 2001, a Stormwater Management Plan was prepared for the City of Snohomish, Washington (City). Since that time, new areas have been annexed, capital projects have been constructed, the City has developed and implemented a NPDES Phase II Program, and the City has updated their stormwater utility funding program. The City has also adopted the 2005 Washington State Department of Ecology Stormwater Management Manual for Western Washington (Ecology Manual), made updates to the City of Snohomish Comprehensive Plan, and prepared a Combined Sewer Overflow Reduction Plan Update.

In April 2012, the City of Snohomish authorized the development of a Stormwater Comprehensive Plan Update. This Stormwater Comprehensive Plan (Plan) for the City of Snohomish is an update to the June 2001 report prepared by RW Beck entitled, "Final Stormwater Management Plan," (2001 Plan).

The purpose of this plan is to guide the City's Stormwater Utility programs in a manner consistent with applicable local, state, and federal regulations. The plan includes:

- Identification of proposed solutions to flooding and water quality issues.
- Actions necessary to comply with applicable federal, state, and local requirements, in particular, the Western Washington Phase II Municipal Stormwater Permit (Phase II Permit).

The Plan update includes an evaluation of the study area; a review of drainage basin boundaries and characteristics; public outreach to seek input on known surface water, drainage, and water quality concerns; development of approaches to resolve stormwater problems; review of operation and maintenance practices; and Capital Improvement Program (CIP) development for proposed stormwater improvements. In 2010, the City updated their funding program (FCS 2010); therefore, financial analysis was not completed for this Plan. The recommended CIP will utilize available funding through the City's stormwater utility.

This report is organized into eight sections:

1. Introduction to the stormwater program, the purpose of the Plan, and the general methods employed to develop the Plan.
2. Presentation of planning data relevant to the stormwater program and the goals and objectives of the Plan.
3. Description of the existing conditions within the study area.
4. Description of the hydrologic analysis completed for the Plan update.
5. Stormwater management program and activities required to comply with the Phase II Permit and defined program goals.
6. Citywide and site-specific stormwater problems and proposed solutions.
7. Discussion of opportunities for separating stormwater from combined (storm and sewer) systems.
8. Recommendations for implementation of the stormwater management program activities and projects.

The plan appendices provide improvement summary forms for proposed projects, estimated project costs, a SEPA checklist for the plan, and calculations.

2.0 PLANNING DATA

2.1 GOALS AND OBJECTIVES

The general objectives of this report are to prepare a plan that will serve as a guide for the continued improvement of the stormwater system for the City of Snohomish, to manage surface water runoff to protect people and property, and meet water quality and resource protection goals.

2.2 SCOPE OF WORK

Project goals and objectives will be met by completing the following tasks:

Data Collection and Review

- Review of the 2001 Plan and current regulations.
- Review of available mapping and recent and relevant documents (see Section 2.4).

Existing Study Area Definition

- Update planning data per the recent updates to the City Comprehensive Plan, including:
 - Land use and zoning, and
 - Climatic and topographic information.
- Evaluation of an expanded study area to include the North Planning Area and additional drainage basin contributions from newly annexed areas.
- Revise drainage basin delineations based on best-available GIS technology.
- Evaluate the existing and future conditions of the drainage basins.
- Revise hydrologic and hydraulic modeling for selected project areas.
- Incorporate City-staff knowledge of conveyance and flooding issues, water quality issues, operations and maintenance issues, and infrastructure improvements or changes.
- Complete site visits to evaluate known stormwater-related issues for incorporation into the existing conditions and stormwater inventory.
- Conduct a public meeting to identify the public's concerns with respect to the current stormwater facility.

Programmatic Recommendations

- Update programmatic recommendations including operation and maintenance (O&M) issues.
- Evaluate soils within the study area to determine the planning-level feasibility for Low Impact Development projects. Develop a map tool for use by the City, land owners and developers.

Identify and Develop Alternative Solutions to Stormwater Problems

- Identify problems and recommend improvements for control and mitigation of surface water quantity and quality issues.

- Coordinate with the City current stormwater problem areas and potential future problem areas due to growth or regulatory change. Provide alternative analysis and recommendations for more complex problems.
- Compile a list of stormwater-related problems, opportunities, and recommended alternatives. Develop a program of prioritized capital improvements for the construction of facilities included in the comprehensive plan.
- Review sensitive areas, wetlands and steep slopes for the potential effect on or by future development and stormwater impacts.
- Evaluate potential environmental impacts created by the list of capital improvements and draft a checklist in accordance with State Environmental Policy Act (SEPA) requirements.

2.3 PUBLIC INVOLVEMENT

Public participation is an important part of this Plan. The public's opinions and concerns were gathered at a public meeting held on November 27, 2012. The objective of the meeting was to inform local property owners about the Plan update and to provide the public the opportunity to provide input to the Plan by helping identify stormwater problem areas. The following problem areas, identified by City staff were presented at the Public Meeting:

- 87th Avenue SE (Sinclair Avenue);
- Swifty Creek (at Second Street);
- Maple Avenue (Unopened Fairview Street);
- Park Avenue/Blackmans Lake;
- 16th Street and Holly Vista Drive;
- Third Street and Avenue D; and
- Cypress Avenue.

No new areas were identified by the public during the meeting. The problem areas listed above and others later added are described in Sections 6.0 and 7.0.

2.4 PREVIOUS STUDIES AND REPORTS

The following documents were referenced during the preparation of this report:

- June 2001 Stormwater Comprehensive Plan (RW Beck), Volumes 1 and 2;
- June 2001 Stormwater Comprehensive Plan (RW Beck), HSPF Model support files;
- October 2004 Environmental Report (Tetra Tech/KCM);
- May 2005 CSO Reduction Plan Update (Tetra Tech/KCM);
- 2010 Rate Study (FCS);
- January 2009 Annexation History Map (City of Snohomish);
- December 2010 Comprehensive Plan (City of Snohomish);
- 2011 Illicit Discharge Detection and Elimination Program Manual (City of Snohomish);
- December 2011 Land Use Designations Map (City of Snohomish);

- 2012 Stormwater Management Program (City of Snohomish);
- 2012 GIS Stormwater Inventory Data (Gray & Osborne, Inc.);
- February 2012 Stormwater System Map (Gray & Osborne, Inc.); and
- June 2012 GIS Stormwater Network Data from Snohomish County.

3.0 EXISTING CONDITIONS

3.1 STUDY AREA

The original study area from the 2001 Plan included the incorporated city limits of Snohomish as well as adjoining unincorporated areas of Snohomish County. There were two study areas for 2001 Plan. The first larger study area is the Joint Comprehensive Planning Area (JCPA). The second study area is the Urban Growth Area (UGA).

The study area was expanded for this Plan to include the following:

- The North Planning Area, north of US Highway 2, and contributing areas.
- Additional areas to the west of the original study area that contribute flow to the Upper Cemetery Creek and Lower Cemetery Creek basins.
- Additional areas to the east of the original study area that contribute flow to the Pilchuck basin.

The drainage basin characterization and land use are described in Section 3.4.

3.2 DRAINAGE BASINS

The entire study area is approximately 4,869 acres, consisting of the eight drainage basins described below. Each drainage basin ultimately flows into either the Pilchuck River or the Snohomish River. See Figure 1, Basin Map, for drainage basin delineations.

The drainage basin area tributary to the UGA is approximately 4,314 acres and includes Cemetery Creek, the South Fork of Bunk Foss Creek, Swifty Creek, and Blackmans Lake drainage basins. These water bodies ultimately discharge to the Pilchuck River or the Snohomish River. Figure 1 shows the major drainage basin delineations. Following is a brief description of the drainage basins within the study area.

3.2.1 Upper Cemetery Creek

The Upper Cemetery Creek basin is in the northwest corner of the study area, and consists of 875 acres contributing to Cemetery Creek upstream (north) of State Route 9. This basin was modified slightly from the 2001 RW Beck plan to reflect contributory areas based on updated topographic information and the storm drain network within the US Highway 2 right-of-way. The basin is comprised mostly of single family and rural residential area.

One stormwater problem area (C-1) has been identified in this basin and is discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area locations.

3.2.2 Lower Cemetery Creek

The Lower Cemetery Creek basin is the westernmost basin, and consists of approximately 1,015 acres contributing to Cemetery Creek downstream (south) of State Route 9 until it discharges to the Snohomish River. This basin was modified slightly from the 2001 RW Beck plan to reflect contributory areas based

on updated topographic information. The basin is comprised mostly of single family and rural residential area.

One stormwater problem area (C-11) has been identified in this basin and is discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area locations.

3.2.3 Blackmans Lake Basin

The Blackmans Lake basin is in the north-central portion of the study area, and consists of approximately 465 acres, including Blackmans Lake. The lake is approximately 57 acres with a mean volume of 800 acre-feet. In general, the basin is bordered on the west by State Route 9, on the north by US Highway 2, and on the east by Pine Avenue. The basin is mostly undeveloped or rural residential. There is some medium-density residential development near the lake. The lake discharges to Swifty Creek on the south side, west of Avenue A. The Blackmans Lake Phase I Restoration Study (KCM 1993), characterizes the water quality of the lake and identifies a management strategy for the lake and the tributary area that is intended to improve and protect its water quality.

Two stormwater problem areas (C-4 and C-12) have been identified in this basin and are discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area locations.

3.2.4 Swifty Creek Basin

The Swifty Creek drainage basin is in the south-central portion of the study area, and consists of approximately 330 acres contributing to Swifty Creek, from the outlet to Blackmans Lake to the Snohomish River, near the downtown Snohomish Historic District Boundary.

Because Swifty Creek is the outlet to Blackmans Lake, this basin technically includes the entire tributary area to Blackmans Lake (approximately 465 acres, including Blackmans Lake), for a total of approximately 795 acres. The Swifty Creek basin is almost completely developed and, as shown in Table 3-1, several land use categories are represented in this basin. The basin is generally bordered to the west by Avenue D, to the north by Blackmans Lake, to the east by Pine Avenue, and to the south by the commercial downtown area.

Local nomenclature identifies Swifty Creek as the outlet from Blackmans Lake that flows south in an open channel to the junior high school campus (Freshman Campus), where it enters a 36-inch concrete pipe. There are several roadway culvert crossings between Blackmans Lake and the Freshman Campus. Capacity problems were reported in the 2001 Plan, which have been resolved since that time.

Once the creek enters the 36-inch pipe, it flows east-southeast across the playfield and changes to a 30-inch-diameter pipe before entering a diversion manhole on the east side of the campus. The diversion manhole has a weir constructed inside, which diverts all low flows east to the Pilchuck River. During high flows, excess flows continue south in the original Swifty Creek channel toward the downtown area. The pipe that conveys flows to the Pilchuck River runs east along Sixth Street. The original Swifty Creek system continues south in a 30-inch concrete pipe that discharges to an open channel just south of 5th Street. The open channel continues south, with culvert crossings at Fourth Street and Cedar Avenue to an open channel behind AA Rentals on the north side of Second Street. The open channel discharges to a 24-inch pipe that conveys flows under the downtown area to the Snohomish River.

One stormwater problem area (C-2) has been identified in this basin and is discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area location.

3.2.5 Bunk Foss Basin

The Bunk Foss basin is in the northeast corner of the study area, and consists of approximately 1,025 acres contributing to Bunk Foss Creek. Bunk Foss Creek is a right bank tributary of the Pilchuck River and gains flow from Clarks Fork, Fields Fork, and an unnamed tributary before draining into the Pilchuck River.

This basin was expanded significantly from the 2001 report to include the area outside of the UGA that drains to Bunk Foss Creek; the prior report provided information for only Clarks Fork, the southern fork of Bunk Foss Creek. Over one third of the basin includes a portion of the north planning area outside of the UGA boundary.

Clarks Fork drains approximately 200 acres located in the northeast portion of the study area. A portion of this basin is currently undeveloped. The developed portion is mostly low density or rural residential. The tributary drainage area extends as far south as 16th Street and is bordered by Pine Avenue on the west and Terrace Avenue on the east. Further to the north, near Highway 2, the basin widens to the east and west.

The main stem of Bunk Foss Creek collects flow from the land adjacent and to the south of Highway 2 as well as West Fields Fork and East Fields Fork, which are north of Highway 2. The main stem crosses Highway 9 south of Highway 2 within the Highway 2-Highway 9 interchange, then passes under 52nd Street SE on the south side of Highway 2. The confluence of Clarks Fork and the main stem is on the south side of Highway 2. Downstream of the confluence, the creek enters a 72-inch corrugated metal pipe (CMP) culvert passing under Highway 2. Bunk Foss Creek crosses under Old Machias Road, near the confluence with the unnamed tributary, and then crosses back to the south side of Highway 2 through a roadway culvert. The creek then crosses beneath South Machais Road and continues in a southeast direction prior to its confluence with the Pilchuck River.

The North Planning area is largely comprised of the Bunk Foss Creek drainage area outside of the City Limits and UGA. No stormwater problem areas have been identified in this basin.

3.2.6 Pilchuck River Basin

The Pilchuck River basin is the easternmost basin within the study area, and consists of approximately 466 acres flowing to the Pilchuck River.

There are three outfall locations to the Pilchuck River, which are shown on Figure 3. These are located along the Pilchuck River at Sixth Street, Seventh Street, and Grove Street. Stormwater also discharges to the Pilchuck River through open channels located at Fourth Street. Runoff from a portion of the area enters the river by surface and subsurface flow with no specific discharge point.

Five stormwater problem areas (C-3, C-5, C-6, C-9, and C-10) have been identified in this basin and are discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area locations.

3.2.7 Snohomish River Basin

The Snohomish River basin is the southernmost basin within the study area, and consists of approximately 445 acres flowing to the Snohomish River.

The southernmost portions of the study area drain to the Snohomish River. The basin area includes the land between First Street and the river as well as the area south of the river to the Airport Way-Highway 9 intersection. Runoff from most of this area enters the river by surface and subsurface flow, with no specific discharge point. However, there is a 20-inch stormwater overflow outfall located at the intersection of First Street and Lincoln Avenue. The outfall pipeline extends southwest and enters the Snohomish River approximately 600 to 800 feet downriver from the railroad bridge, near the confluence of the Pilchuck and Snohomish Rivers.

No specific problems have been identified in this basin. The area is within the 100-year floodplain and, with the exception of the airport and mill, a significant portion of the area is undeveloped and/or is currently being used as agricultural land. It is difficult to anticipate problems that will result from future development in this area because it is not known exactly how the area will develop. However, because the area is in the floodplain, development would likely require filling and subsequently, compensatory mitigation (excavation) to support a no-net rise of the 100-year flood plain, according to development standards. Future development will require site-specific planning for surface water management. For these reasons, no specific recommendations for managing surface water in the area south of the Snohomish River were identified as part of this planning process.

One stormwater problem area (C-8) has been identified in this basin and is discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. See Figure 1 for problem area locations.

3.2.8 Combined Sewer Area

The Combined Sewer Area comprises most of the downtown Snohomish area, with stormwater flows joining the sanitary system, and flowing to the wastewater treatment plant west of downtown, or to one of the two Combined Sewer Overflows (CSOs) along the Snohomish River. This area consists of approximately 248 acres (see Figure 4).

Most of the downtown commercial area and the residential area northwest of the downtown commercial area are within the combined sewer area. Runoff from this area discharges to the sanitary sewer system. Since stormwater runoff from this area is collected in the sanitary sewer system, these flows are managed by that system.

See Section 7.0 for a more in depth description of the Combined Sewer Area, including recent proposed upgrades for separation of stormwater from wastewater.

Stormwater problem area (C-7) has been identified in this basin and is discussed in Section 6.0 Conveyance System Problem Identification and Solution Development. Also, a proposed CSO separation project (C-13) has been identified in the area and is described in Section 7.0 Separated Storm Drainage System for the Combined Sewer Area. The proposed CSO separation project will benefit the Combined Sewer Area as well as the Snohomish River Basin. See Figure 1 for problem area locations.

3.2.9 North Planning Area

The North Planning Area includes parcels in three drainage basins: Upper Cemetery Creek and Bunk Foss. This area consists of the expected future expansion north of the UGA, north of US Highway 2, and is approximately 556 acres.

3.3 SOILS

Soil information was gathered from the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey website, as well as the Soil Survey Report for Snohomish County Area, Washington (USDA Soil Conservation Service July 1983).

Area soils are primarily of the Tokul group – Tokul gravelly loam and Tokul silt loam that formed in glacial till and volcanic ash. These soils are moderately deep and moderately well drained and have moderate permeability. The slopes range from 0 to 25 percent and they are typically underlain by a hardpan at a depth of less than 3 feet.

Soil mapping for the study area is presented on Figure 2: Soil Type Suitability for Low Impact Development (see Section 5.0). Tokul silt loam and Tokul gravelly loam are classified within hydrologic group C, having moderately high runoff potential and low infiltration rates when thoroughly wetted. Based on the predominant soil type, hydrologic modeling is based on hydrologic soil group C.

For purposes of this study, the mapping specifically categorizes the soils into three groups based upon their hydrologic properties: glacial till, glacial outwash, and wetland soils. The study area is predominated by till soils that cover 77 percent of the land area.

3.4 EXISTING LAND USE DESIGNATIONS

The land use designation information, within the UGA, was provided by the City Land Use Map (City of Snohomish 2011b). The land use designation, outside the UGA was provided by Snohomish County's General Policy Plan (Snohomish County 2012). The land use designations in the study area are commercial, residential, open areas, industrial, and the north planning area. The study area is comprised of areas within each basin boundary and is represented on Figure 1.

The basins that are described in Section 3.2 are divided into different land use designations. The impervious percentages for residential and commercial land use designations that were developed in the 2001 Plan (RW Beck 2001) were adopted for this current Plan. The effective impervious percentages used for hydrologic modeling purposes for low-density residential, medium-density residential, high-density residential, and multifamily residential are 4, 10, 25, and 50 percent, respectively.

Also in the 2001 Plan, the commercial land use designation was divided into three categories: 20, 50, and 80 percent effective impervious areas (RW Beck 2001). The commercial land use designation provided by the 2011 City Land Use Map and Snohomish County's General Policy Plan did not divide the commercial land use into three categories to identify the effective impervious areas. For hydrologic modeling, the impervious area within the commercial land use designation was verified by interpretation of the aerial photograph.

The delineated north planning area, discussed in Section 3.2.9, is outside of the UGA and was provided by Snohomish County's General Policy Plan (Snohomish County 2012). The north planning area is both

a delineated area and a land use designation. For hydrologic modeling, the impervious area within the north planning area land use designation was verified by interpretation of the aerial photograph.

The pervious areas of the watershed were assumed to be in good condition with grass cover on more than 75 percent of the area. The impervious and pervious percentages for each land use designation were used in the hydrologic analysis of the problem areas identified by the City. The total drainage basin areas, land use areas, and existing land use designations are presented in Table 3-1.

Table 3-1 Existing Land Use Designations (Acres)

Land Use	Upper Cemetery Creek	Lower Cemetery Creek	Blackmans Lake	Swiftly Creek	Combined Sewer Area	Pilchuck River	Bunk Foss	Snohomish River	Total

The distribution of existing land use designations are summarized by percentage in Table 3-2.

Table 3-2 Existing Land Use Designation Summary

Land Use Designations	Distribution
Commercial	11%
Residential (total)	57%
Single Family	27.5%
High-density Residential	0.5%
Medium-density Residential	3.0%
Low-density Residential	26%
Open Area	20%
Industrial Area	11%
Blackmans Lake	1%
Total (within UGA Boundary)	100%

The North Planning Area is under evaluation and was not included in Table 3-2: Existing Land Use Designation Summary.

3.5 FISH HABITAT

There are three major streams in the City of Snohomish UGA: Bunk Foss Creek, Cemetery Creek, and Swifty Creek. The streams are all Class 2 streams. They are not large enough to be considered “Shorelines of the State” but they all provide some salmonid habitat. In addition, WDFW stocks Blackmans Lake with trout (Steward 2004).

Several previous studies of these stream courses have been performed within the City of Snohomish UGA. The City completed critical areas mapping in 1991 as required by the Growth Management Act (GMA) of 1990. In addition, RW Beck inventoried streams within the City of Snohomish to evaluate fisheries resources and to identify problems associated with those resources. The inventory focused on field observations of the three major streams within the City of Snohomish and is limited to the portions of these streams within the 2001 Urban Growth Boundary (RW Beck 2001). Subsequently, Steward and Associates prepared an Endangered Species Act Response Plan for the City of Snohomish in 2004 (Steward and Associates 2004).

All three streams display varying effects from past and present development. Clearing of riparian vegetation has resulted in a loss of cover for fish, increased erosion, and loss of shade, which results in increased summertime stream temperatures. Portions of some drainages have been channelized or “ditched.” Culverts have been installed for road crossings of streams. Fish migration barriers consist primarily of culverts. Most of these barriers are partial and serve to block fish migration only under certain stream flow conditions (RW Beck 2001). Bunk Foss Creek and Cemetery Creek are still used to some extent by salmonids for rearing and spawning. Swifty Creek however has fish passage barriers that have eliminated salmon migration from the Snohomish and Pilchuck Rivers (Steward 2004).

In addition to the three major streams, two rivers flow through or are adjacent to the City of Snohomish UGA. The Snohomish River in the vicinity of the city supports several salmonid species, including Chinook salmon (federally listed threatened), coho salmon, chum salmon, pink salmon, sockeye salmon, bull trout/Dolly Varden (federally listed threatened), and steelhead (federally listed threatened). Of these

species, summer Chinook salmon are documented to spawn in this portion of the river (WDFW 2010).

The Pilchuck River in the vicinity of the City supports several salmonid species, including Chinook salmon (federally listed threatened), coho salmon, chum salmon, pink salmon, sockeye salmon, bull trout/Dolly Varden (federally listed threatened), steelhead (federally listed threatened), whitefish, and rainbow and cutthroat trout (Steward and Associates 2004).

A further description of the Snohomish and Pilchuck Rivers' physical properties and surrounding land use patterns can be found in the City of Snohomish Master Program Draft Shoreline Inventory and Characterization (ESA 2010). Additional information on the Pilchuck River can be found in Habitat Conditions and Chinook Use in the Pilchuck River (Savery and Hook 2003).

3.6 EXISTING WILDLIFE HABITAT

The Washington Department of Fish and Wildlife (WDFW) maintains a list and mapping of priority habitats and species throughout the state. Priority habitats are those that have a high value to many fish and wildlife species and may be limited or vulnerable. Priority species are those requiring protection or management to ensure their survival. Priority wildlife habitats mapped in the City's UGA include wetlands, riparian zones, and urban natural open space. The wetlands, open water areas, and shoreline trees provide foraging and nesting habitats for priority species such as waterfowl, bald eagle, bats, great blue heron, and pileated woodpecker.

Portions of the study area have been extensively developed with both residential and commercial land uses. Within these areas, vegetation has often been cleared or replaced by ornamental plants and landscaping.

Mammals that are likely to occur in the study area habitats include raccoons, coyotes, opossums, various rodents, cottontail rabbit, and black-tailed deer. In addition, a variety of songbirds, waterfowl, reptiles, and amphibians are expected to use these habitats.

3.7 WETLANDS

Wetlands within the City are primarily classified as fresh water, non-tidal ("palustrine") wetlands. The majority of these palustrine wetlands are emergent wetlands currently in use as pasture or open fallow land. Forested and/or scrub-shrub wetlands were also identified along stream corridors throughout the study area. Forested wetlands are associated with Cemetery Creek and its tributaries, as well as Bunk Foss Creek. The largest wetland within the study area is Blackmans Lake and associated forested, scrub-shrub, and emergent wetlands surrounding the lake. Blackmans Lake is considered a lacustrine, open water wetland. Other open water wetlands found in the study area are limited to farm ponds, most of which are manmade. Palustrine wetland habitat was verified within those areas of Snohomish, which are located within the floodplain of the Snohomish River. Floodplain wetlands identified are largely cultivated, emergent wetlands, or scrub-shrub wetlands occurring near the existing sewage treatment lagoon.

Of particular note is a large wetland complex is located adjacent to the City's wastewater treatment plant. This wetland includes palustrine emergent, scrub-shrub, and forested vegetation communities. The wetland covers approximately 18 acres (ESA 2010). Cemetery Creek meanders through this wetland system and discharges to the Snohomish River at a point just north and west of the city limits. This

wetland is believed to be part of a historical meander of the Snohomish River that was cut off when the river was channelized. Tides now create large off-channel pools in the wetland that may provide salmonid juvenile rearing and adult holding habitat (Steward and Associates 2004).

3.8 BLACKMANS LAKE

Lakes are typically defined as bodies of open fresh water greater than 20 acres in size. Based on this definition, Blackmans Lake is the only lake within the study area. Blackmans Lake has a surface area of approximately 57 acres and a total watershed area of 465 acres, which includes the lake. It is surrounded by single family residential development and some wetland areas. The lake's maximum depth is 29 feet. Blackmans Lake Creek and Grassy Bottom Creek enter the north side of the lake. Swifty Creek is the outlet stream from Blackmans Lake and discharges to the Snohomish River near Cady Park (ESA 2010).

A narrow, blind channel known as Champagne Lane extends from the northeastern side of the lake. This channel is maintained by local homeowners (ESA 2010).

The average storage volume of Blackmans Lake is 800 acre-feet. With approximately 150 acre-feet of available storage, the lake provides enough detention storage to control peak flows in Swifty Creek (RW Beck 2001).

A further description of Blackmans Lake's physical properties and surrounding land use patterns can be found in the City of Snohomish Master Program Draft Shoreline Inventory and Characterization (ESA 2010).

4.0 HYDROLOGIC ANALYSIS

Hydrologic modeling for existing and future land use conditions was conducted for the 2001 Plan. This modeling was reviewed and used to the extent practical while evaluating existing and proposed stormwater infrastructure for this updated plan.

The 2001 hydrologic modeling was performed using U.S. EPA’s Hydrologic Simulation Program-Fortran (HSPF) model. HSPF is a sophisticated computer modeling program that simulates land surface and instream hydrologic processes. The model is used to transform a long time-series of observed rainfall and evaporation data into a time-series of runoff using a continuous accounting of soil moisture levels.

Depending on the application and purpose, the HSPF model can provide an advantage over more traditional event-based models. Event-based models simulate flow for individual storms only; while HSPF can estimate flow over a period of record, including evaluating specific historic storms. The 2001 hydrologic modeling involved four basic steps:

- Definition of drainage basin and subbasin characteristics.
- Calibration with recorded flow data.
- Simulation of runoff for current and future land use conditions.
- Frequency analysis of simulated runoff data to provide design inflow hydrographs to the storm drainage system.

Definition of the drainage basin area for the 2001 Plan included a smaller study area than the current Plan. Several new areas have been annexed since 2001 and a larger area to the North is included in the Basin areas for this Plan. Comparing basin size between 2001 and 2013 (Table 4-1), the current plan includes a larger portion of the drainage areas for the basins to the north and west of the City for the Upper Cemetery Creek Basin and the Bunk Foss Basin. Other small differences in basin size occurs for several basins because the 2013 basin delineation is based on more recent data and employed modeling techniques using GIS.

Table 4-1 Comparison of Drainage Basin Area from 2001 to 2013

Drainage Basin	2001 Area (acres)	2013 Area (acres)
Upper Cemetery Creek	558	875
Lower Cemetery Creek	1,024	1,015
Blackmans Lake	448	465
Swift Creek	357	330
Combined Sewer Area	238	248
Pilchuck River	456	466
Bunk Foss	514	1,025
Snohomish River	501	445
Total	4,096	4,869

Drainage basin characteristics for this Plan are based on existing land use designations as described in Section 3.4. The percentage of impervious area based on land use that was developed for the 2001 modeling was adopted for this Plan.

Model characteristics and inputs were reviewed and coordinated with City staff to identify known changes and improvements since 2001. Focus areas included stormwater system improvements, new or worsened capacity problems, and new or worsened water quality problems. Several capacity issues were identified and are described in Section 6.0. One water quality problem in the Combined Sewer Area was identified and is described in Section 7.0.

In general, capacity issues are mainly related to undersized or non-existent stormwater infrastructure. Upgrades of these facilities require specific design methods outlined in the Engineering Design and Construction Standards (City of Snohomish 2004). Conveyance design requires evaluation using event-based storms; where pipes shall be sized to convey the 25-year 24-hour storm and be evaluated for flooding and erosion concerns that may occur during the 100-year 24-hour storm. Therefore, modeling with HSPF was not required. The stormwater quality problem was for the Combined Sewer (Combined Utility) Area, which is almost completely developed. A simple hydrologic model using the Department of Ecology Western Washington Hydrology Model (WWHM) was used to estimate the wetpool volume to evaluate the feasibility of converting the former wastewater lagoon into a stormwater quality treatment facility. Stormwater calculations are provided in Appendix D.

The 2001 HSPF modeling evaluated watersheds and streams with culverts and other infrastructure. The model was calibrated using known data for both existing and future land use conditions. The model estimated peak flows for existing and future conditions, including evaluation of the 2-, 10-, 20-, and 100-year peak flows.

Table 4-2 provides a summary of existing and future flows calculated in 2001 for several locations throughout the City. The difference between existing and future peak flows was compared for the 100-year peak flow to examine the potential increase in flow at a particular location. By dividing the future 100-year peak flow by the existing 100-year peak flow a ratio of increase could be readily evaluated. For example, Cemetery Creek at Bickford Road, south of Skipley Road had an existing and future 100-year peak flow of 10.8 cfs and 11.2 cfs respectively. The ratio of 11.2 divided by 10.8 is 1.04, or 1.0; which correlates to a minor increase from existing to future conditions. Evaluating the Cemetery Creek crossing at Weaver Road yields a ratio of 2.5, which notes a significant increase. Table 4-2 is highlighted in yellow for moderate increases in flow between existing and future conditions (ratios of 1.5 to 2.0), and highlighted in blue for significant increases between existing and future conditions (ratios greater than 2.0).

These locations were reviewed with City staff to determine if project improvements are required for this Plan. Several projects listed in this table have been completed and many had no current flooding or conveyance concerns. Both completed projects and those without present day problems were flagged for continued monitoring. Monitoring is discussed in Section 5. Three projects that were identified in the 2001 Plan remain and new projects have been identified (C-4, C-5b, and C-12).

From a programmatic perspective, as the watersheds develop, it will be important to make sure that development standards are met for flow control; which would help alleviate future peak flows within the creek systems shown in Table 4-2.

Table 4-2 Comparison of Existing and Future Peak Flows (2001 Plan)

Conveyance System Improvement ID from 2001 Plan	Drainage Basin	Location Description	Return Period (Years)								Ratio of Future vs. Existing 100-Year Flow	Comments	Recommended Action
			2-Year Flow (cfs)		10-Year Flow (cfs)		20-Year Flow (cfs)		100-Year Flow (cfs)				
			Existing	Future	Existing	Future	Existing	Future	Existing	Future			
CS-13	Cemetery Creek	Bickford Road South of Skipley Road	5.81	8.11	8.34	9.98	9.17	10.4	10.8	11.2	1.0	Beaver activity within the culvert was causing local flooding (RW Beck 2001). Property owner modified inlet to culvert to alleviate flooding. No flooding has been reported since then. The new installation should be evaluated for hydraulic capacity.	Monitor
CS-11	Cemetery Creek	Weaver Road	17.2	37.9	25.9	58	29	67	35.5	90.4	2.5	Culvert has been replaced.	Monitor
CS-10	Cemetery Creek Anderson's Fork	Weaver Road	4.34	5.56	6.71	9.09	7.69	10.6	10.1	14.2	1.4	Culvert is under capacity for the 10-year event under existing land use conditions (RW Beck 2001). This culvert replacement is low priority until significant development occurs in the upstream tributary area.	Monitor
	Cemetery Creek	72nd Street SE	23.7	50.5	35.7	78.7	39.9	91.2	48.7	124	2.5	No flooding problems have been reported.	Monitor

CS-3	Pilchuck River	South Maple Avenue	14.1	14.1	23.3	23.3	27.9	27.9	40.8	40.8	1.0	No flooding problems reported.	Monitor
CS-2	Snohomish River Basin	Avenue D between Sixth Street and railroad ROW										Project has been completed.	Monitor
CS-4	Snohomish River Basin	Southwest Corner of Avenue D and First Street										Flooding and erosion on southwest corner of Avenue D and First Street. The existing 12-inch culvert should be replaced with a 24-inch concrete culvert. The water quality runoff to the ditch discharging to the culvert was improved through the installation of a water quality vault. Project is complete.	Monitor
CS-12	Cemetery Creek	87th Avenue SE and Fobes Road										Considerable sediment buildup on the downstream end of the culvert under Fobes Road (RW Beck 2001). No other flooding problems have been reported.	Monitor

Notes:

* The location identified by the 2001 Plan was also identified as a problem area for the 2013 Plan. See Section 6.0 for descriptions of New Projects.

Ratio between existing and future 100-year flow greater than 1.5

Ratio between existing and future 100-year flow greater than 2.0

5.0 PROGRAMMATIC EVALUATION AND RECOMMENDATIONS

This section describes the City's stormwater management program and the evaluation of programmatic alternatives evaluated for this Plan.

5.1 NPDES PHASE II PERMIT

The City of Snohomish is regulated under the National Pollutant Discharge Elimination System (NPDES) Western Washington Phase II Municipal Stormwater Permit.

The NPDES Permit is a federal permit that regulates stormwater and wastewater discharges to waters of the State. While it is a federal permit, the regulatory authority was passed on to the Washington State Department of Ecology (Ecology). In response, Ecology developed and issued the Western Washington Phase II Municipal Stormwater Permit (Permit). The Permit was issued by Ecology in January 2007 and was modified in June 2009. Ecology reissued the Permit unmodified on August 1, 2012 at legislative direction to be effective through July 31, 2013. After an extensive public process, Ecology also reissued the updated 2013 to 2018 permit on August 1, 2012. The Permit for western Washington covers approximately 80 cities and portions of five counties with an effective date of September 1, 2012. The updated 2013-2018 permit will become effective on August 1, 2013.

5.2 STORMWATER MANAGEMENT PROGRAM

All municipalities affected by the Permit are required to create and implement a Stormwater Management Program (SWMP). The Permit requires the SWMP be designed to reduce the discharge of pollutants from the regulated small Municipal Separate Storm Sewer Systems (MS4) to the maximum extent practicable and to protect water quality. The SWMP is to be developed and implemented in accordance with the schedules set forth by the Permit. Each Permittee is required to prepare written documentation of the SWMP. The SWMP shall include an ongoing program for gathering, tracking, maintaining, and using information to evaluate SWMP development, implementation and permit compliance and to set priorities.

According to the Permit, the SWMP shall address the following five minimum program elements, plus a sixth element triggered by the Total Maximum Daily Load (TMDL) status for the Snohomish River:

- 1) Public Education and Outreach.
- 2) Public Involvement and Participation.
- 3) Illicit Discharge Detection and Elimination.
- 4) Controlling Runoff from New Development, Redevelopment and Construction Sites.
- 5) Municipal Operations and Maintenance Program.
- 6) Compliance with TMDL Requirements.

Elements addressed in the SWMP are described in the following subsections.

5.2.1 Public Education and Outreach

The SWMP includes an education program aimed at residents, businesses, industries, elected officials, policy makers, and planning staff. The goal of the education program is to reduce or eliminate behaviors and practices that cause or contribute to adverse stormwater impacts.

The City of Snohomish SWMP is updated annually and submitted with the City's Annual Report to Ecology. The City of Snohomish posts this document on the City of Snohomish web site, www.ci.snohomish.wa.us, so it can be viewed by the public. The SWMP includes directions to the public for providing comments and input to the SWMP.

The City's education and outreach program is summarized by year as follows (City of Snohomish 2012):

- 2009: The City began implementing a public education and outreach program in partnership with Snohomish County. It is the City's goal to provide a public education and outreach program that will be prioritized to target the recommended target audiences and subject areas. The City has been working with Snohomish County to explore regional public education and outreach activities and methods of measuring the understanding and adoption of targeted behaviors among the target audiences.
- 2010: The City implemented three public education and outreach programs in partnership with Snohomish County: 1) Pet Waste Management; 2) Natural Yard Care; and 3) Septic System Operation and Maintenance.
- 2011: Education efforts included flyers for carpet cleaners and pressure washers, and education on car washes including outreach for youth fundraising carwashes and general citizen car washing.
- 2012: The City and Streamside Landowners expanded its education and outreach program to include targeted activities directed to painters and food service related businesses. Also in 2012, the City held a second round of natural yard care workshops for its citizens and provided stormwater outreach to properties abutting streams.
- 2013: According to the City's Business Education Plan, education activities intended for landscapers, contractors, and distribution of spill kits to automotive, gas, and convenience businesses are planned for 2013. These activities include distributing educational materials to landscapers on proper techniques to minimize effects on water quality.

General public education opportunities are provided by the City at various public events. The City has provided a booth to increase awareness on how the public can reduce bacterial pollution. At the booth, the City distributes materials about stormwater, wastewater, drinking water, parks and pet waste disposal instructions. A pet waste station and pooper scooper information are included. The booth is managed by a City of Snohomish representative to answer questions. If the representative does not know a response, they are trained to acquire the name and phone number of the person and will have the appropriate City staff person contact the individual to answer any questions they may have. The events include but are not limited to:

- Farmers Market
- Kla Ha Ya Days weekend
- National Night Out
- Snohomish Community Day

Engineers, contractors, developers, review staff and land use planners have also been included in education and outreach program. The City has been assessing the current understanding of stormwater BMPs and stormwater impacts among various City departments and staff members involved in the review and inspection of land development or redevelopment projects. In areas where understanding was below a desired level, the City has provided its staff with information to increase their knowledge. In an effort to reach developers and contractors, the City has added stormwater informational sheets to all new construction and development permit application packages.

5.2.2 Public Involvement and Participation

The City actively pursues public involvement and participation in the development of stormwater management programs, stewardship programs, environmental activities, rate structure development, and other similar activities. Examples of this are an advisory committee that was established to guide initial development of the City's stormwater utility and first stormwater rate structure; development of parks, trails, and open spaces; and volunteer programs for planting of native trees and shrubs in environmentally critical and sensitive areas. The City continues to examine ways to expand existing public involvement opportunities and create new ones.

The City uses its public hearing process to provide an opportunity for the public to make comment on the City's SWMP. The SWMP is posted on the City's website with a request for public comment on the development and update of the SWMP. This process will occur yearly during the permit cycle.

The City has created a surface water web page on its website with links to the SWMP, annual report, educational information, public involvement opportunities, and Quality Assurance Project Plan (QAPP).

5.2.3 Illicit Discharge Detection and Elimination

The City has developed and implemented an ongoing program which includes the compilation of an Illicit Discharge and Detection and Elimination (IDDE) Program Manual (City of Snohomish 2011a). The City had previously developed an IDDE program to meet the requirements of the Permit. The Manual documents the steps necessary to inspect, prevent, educate and document IDDE related issues throughout the City. City staff presently responds to spills, illegal dumps, and actively searches out illicit connections.

Using grant money supplied by Ecology in 2009, the City purchased CCTV equipment to inspect for illicit connections and aid with mapping efforts. Grant money from the 2010 Ecology grant program was used in late 2009 to upgrade the City's CCTV software to make this tool as effective as possible.

IDDE training was provided by Snohomish County in March of 2009 for select City staff. This training was then passed on to all municipal field staff in August 2009. Follow up training was for 30 Public Works employees was conducted in 2011 and will continue every two years.

The City purchased a cargo trailer dedicated solely for IDDE spill response. The outside of the trailer has educational poster-like information pointing out the hazards of illegal discharges.

The City has implemented the 2011 IDDE Manual when removing the source of an illicit discharge. The Manual outlines procedures and presents a flow chart for notification of appropriate authorities and property owners when removing the source of an illicit discharge. Appropriate language has been included in the City's stormwater ordinance which gives the City authority to remove illicit discharges, provides escalating enforcement, and provides for legal actions if the discharge is not eliminated. This ordinance was adopted on July 21, 2009.

More information on IDDE is available in the SWMP (City of Snohomish 2012) and in the IDDE Manual (City of Snohomish 2011a).

5.2.4 Controlling Runoff from New Development, Redevelopment, and Construction Sites

The City of Snohomish adopted the 2005 Ecology Manual and Appendix 1 of the Municipal Stormwater Permit: Minimum Technical Requirements as standards for all new construction and redevelopment within the City's jurisdiction, through the adoption of Ordinance No. 2173 on July 21, 2009.

The Design and Construction Standards and Specifications Section 2: Erosion and Sedimentation Control (City of Snohomish 2004) include design criteria, standard plans, and specifications for temporary erosion and sediment control during construction.

The City of Snohomish currently has a plan review process in place for all sites disturbing a land area of one acre or more, including projects less than one acre which are part of a larger common plan of development or sale as required under the 2005 Ecology Manual.

The 2005 Ecology Manual includes the minimum requirements for water quality and flow control for new construction and redevelopment sites.

The City currently has Certified Erosion Sediment Control Leads (CESCL) on staff to inspect development sites during construction.

5.2.5 Municipal Operation and Maintenance Program

The Permit requires owners to develop and implement an operations and maintenance (O&M) program that includes a training component and has the ultimate goal of preventing or reducing pollutant runoff from municipal operations. The pollution prevention and O&M programs are described in this subsection. The SWMP (City of Snohomish 2012) provides more detailed information.

Maintenance Standards and Inspection

One component of the O&M program is to develop maintenance standards that are as protective, or more protective, of facility function than those specified in Chapter 4 of Volume V of the 2005 Ecology Manual. The purpose of the maintenance standard is to determine if a facility requires maintenance. The 2005 Ecology Manual contains maintenance standards that satisfy this requirement. The City formalized adoption of the 2005 Ecology Manual on July 21, 2009 through the adoption of Ordinance No. 2173.

The City conducts facility inspections annually (except for catch basins) as required by the Permit. A database and other tracking mechanisms have been developed and are used by City inspection personnel to record and analyze data collected while performing inspections of the facilities. Inspection records are used to document findings and determine whether a reduced inspection schedule can be justified in the future.

The City has developed a list of treatment and flow control facilities to inspect when the 10-year 24-hour rainfall threshold is reached. The City conducts these inspections when required and records the results of inspections and any associated facility repairs as needed. If widespread damage or maintenance needs are encountered following this type of storm event, all stormwater treatment and flow control facilities that may be affected are inspected. Repairs or appropriate maintenance actions are completed in accordance with maintenance standards established above, based on the results of the inspections.

In accordance with the Permit, inspection and cleaning of all catch basins and inlets owned or operated by the City was finished in 2010. This work was accomplished using the Maintenance/Technical Ace Crew (M/TAC) established with Ecology grant funding, secured in cooperation with Snohomish County and the

Cities of Snohomish, Lake Stevens, and Granite Falls. Using City labor as matching grant funds, this work was completed at *zero out-of-pocket cost* to the City. Continued maintenance will occur as the need arises.

Unless there are circumstances beyond the City's control, when an inspection identifies an exceedence of the maintenance standard, maintenance is performed:

- Within 1 year for wetpool facilities and retention / detention ponds.
- Within 6 months for typical maintenance.
- Within 9 months for maintenance requiring re-vegetation.
- Within 2 years for maintenance that requires capital construction of less than \$25,000.

Circumstances beyond the permittees control includes denial or delay of access by property owners, denial or delay of necessary permit approvals, and unexpected reallocations of maintenance staff to perform emergency work. If an exceedence of the required timeframe occurs, the City documents the circumstances and how they were beyond their control.

Streets, parking lots, roads and highways

The Permit requires owners to establish and implement practices to reduce stormwater impacts associated with runoff from streets, parking lots, roads or highways owned or maintained by the Permit Holder. Stormwater Pollution Prevention Plans (SWPPP's) have been developed specifically for each department within Public Works and appropriate practices have been deployed.

The following activities are addressed:

- **Pipe cleaning:** A City-owned vacator truck is used for cleaning stormwater system pipes. Pipes that were heavily impacted with sediment and debris were cleaned through the M/TAC process. Moderately impacted pipes were documented and a schedule was put in place for later cleaning.
- **Ditch maintenance and cleaning of culverts that convey stormwater in ditch systems:** The City has a ditch maintenance program that includes cleaning of culverts that convey stormwater in ditch systems. Some ditches commingle road runoff and waters of the state and require a Hydraulic Project Approval (HPA) from Washington Department of Fish and Wildlife prior to conducting maintenance activities. In 2009, the City applied for and received a five-year HPA which allows the City to perform these tasks on a regular basis.
- **Street cleaning:** Snohomish County performs street cleaning weekly through an interlocal agreement. County staff is trained to avoid areas of contaminants such as oil, antifreeze and other similar fluids so sweepings do not become contaminated. County staff notifies City staff of these areas so City staff can place absorbent material and remove contaminants for disposal.
- **Road repair and resurfacing, including pavement grinding:** The City contracts with either Snohomish County or private contractors to perform road repair and resurfacing, including pavement grinding. Those performing the work are required to implement the BMPs necessary to minimize stormwater impacts.
- **Snow and ice control:** The City provides snow and ice control as deemed necessary by the City's police department when unsafe road conditions exist. Snow is plowed on primary travel routes. Washed sand is placed on primary travel routes and known problem areas. Once road conditions return to normal, the City coordinates with Snohomish County who mobilizes sweeper trucks to remove the sand.
- **Utility installation:** The City owns and operates the storm, sewer and water utilities. Qualified staff members perform repairs and maintenance of the utility systems, and contractors are hired to install utilities. The City has developed department-specific SWPPP's to ensure City staff and

contractors follow all appropriate BMPs required to protect the stormwater system. Some installations are done privately as part of development and redevelopment activities. The City requires the use of appropriate BMPs during construction of utilities at development sites.

- **Pavement striping maintenance:** Nearly all pavement striping maintenance in the City is hired out and performed annually by Snohomish County, while minor pavement striping maintenance of parking stalls and some stop bars is performed by City staff. Procedures will be updated as needed to integrate appropriate BMPs.
- **Maintaining roadside areas, including vegetation management:** The City Street Department conducts maintenance of roadside areas including vegetation management. Vegetation management practices are utilized to correct impeded visibility within the ROW or to clear blocked ROW. Presently all vegetation is cut by boom mower during the roadside maintenance process. The City is reviewing current practices and will consider modifying them to leave a grass buffer between the roadway and drainage ditch to control sediment from entering the ditch. A department-specific SWPPP has been developed which addresses these concerns.
- **Dust control:** On City-owned gravel roadways and parking lots, the City annually applies a tree-sap based product to control dust. On construction sites, dust control is occasionally implemented using appropriate BMPs which are employed by a contractor and observed by a City Inspector. The City regularly evaluates its dust control procedures to ensure the best practices and methods are being used and BMPs are in place.

City-owned/maintained land

Establishment and implementation of policies and procedures to reduce pollutants in discharges from land owned or maintained by the City is required by the Permit. Examples of such land include parks, open space, road ROW, maintenance yards, and stormwater treatment and flow control facilities. Department specific SWPPPs have been developed and implemented to address these issues. The City has also developed and implemented a SWPPP for the municipally owned maintenance yard. The SWPPPs address the following:

- **Application of fertilizer, pesticides, and herbicides** including the development of nutrient management and integrated pest management plans. Several City staff members are licensed to apply pesticides and herbicides. They receive regular training and recertification. The City adopted an Integrated Pest Management Plan in December 2009.
- **Sediment and erosion control.** The City has five CESCL certified maintenance workers. The City Public Works Inspector, Building and Fire Official, Operations Managers and two Project Engineers are also CESCL certified.
- **Landscape maintenance and vegetation disposal.** Training in the area of appropriate practices for landscape maintenance and vegetation disposal is being considered. Staff members will be trained to implement procedures while performing landscape maintenance that will greatly reduce or eliminate pollutant discharges into stormwater.
- **Trash management.** The City of Snohomish contracts with a private hauler for the collection of solid waste and recyclable materials. The City will review its current contract and will look for language that obligates the contractor to reduce pollutants in discharges during the collection process. The City will consider placing requirements in future solid waste contracts to further reduce pollutants generated during the collection process.
- **Building exterior cleaning and maintenance.** The City of Snohomish is aware of the impacts to water quality that can be caused by building exterior cleaning and maintenance. Training has been conducted for the staff members that provide exterior cleaning and maintenance at City facilities. These staff members have been informed of BMPs available to reduce stormwater

impacts. On-going training will be provided as needed to ensure that proper BMP's are being used.

- **Heavy equipment maintenance or storage yards, and material storage facilities.** In accordance with the Permit, the City has developed and implemented SWPPPs for heavy equipment maintenance and storage yards, and material storage facilities owned or operated by the City in areas subject to the Permit. Copies are available from the Public Works Department.

Employee Training Program

The Permit requires owners to develop and implement an on-going training program for employees whose construction, operations or maintenance job functions may impact stormwater quality. The training program shall address the importance of protecting water quality, the requirements of the Permit, operation and maintenance standards, inspection procedures, selecting appropriate BMPs, ways to perform their job activities to prevent or minimize impacts to water quality, and procedures for reporting water quality concerns, including potential illicit discharges. The City has conducted numerous trainings to date and will continue with its ongoing training program. City staff will seek opportunities to train with other jurisdictions to reduce costs and benefit from the knowledge and skills of other jurisdictions. The City routinely documents and maintains records of training provided.

Record Keeping

The City presently maintains a record of all repair and maintenance activities conducted by its staff in accordance with the Permit. Efforts were undertaken in 2012 to incorporate these records into an electronic format that can be imported to the GIS system. Currently the City is in the process of labeling its catch basins and pipes so that maintenance documentation can be incorporated more easily into GIS.

5.2.6 Compliance with TMDL Requirements

In accordance with the Permit, the City conducts monitoring to determine the effectiveness of the SWMP to control stormwater-related problems that are directly addressed by actions in the SWMP. This component of the monitoring program was designed to answer the following types of questions:

- How effective is a targeted action or narrow suite of actions?
- Is the SWMP achieving a targeted environmental outcome?

A Stormwater Management Program Effectiveness Monitoring Plan was prepared in accordance with Permit requirements (Gray and Osborne, 2010).

Total Maximum Daily Loads (TMDLs) apply to the Snohomish River; therefore, the City is required to comply with TMDL requirements. In 2008, the City of Snohomish began the required water quality monitoring in accordance with the Quality Assurance Project Plan (QAPP) that the City prepared and Ecology approved. Monthly collection and analysis of water quality sampling at the locations identified by the QAPP is ongoing.

The Bacterial Pollution Control Plan (BPCP) (City of Snohomish 2010) was prepared to comply with TMDL permit requirements and addresses topics including but not limited to pet waste ordinance, water pollution control enforcement, educational programs directed at reducing bacterial pollution, investigation and implementation of methods that prevent stormwater bacterial pollution through treatment, reducing runoff volumes, and preventing additional sources of stormwater in association with new development, implementation of activities in the Snohomish Watershed Management Plan

5.3 LOW IMPACT DEVELOPMENT FEASIBILITY

Low Impact Development (LID) is a design approach to manage stormwater runoff as close to its source as possible and helps to protect and restore water quality. LID Best Management Practices (BMPs) are used to reduce runoff flow rates by supporting infiltration and providing water quality benefits by filtering pollutants. BMPs used for LID may include porous pavement, rain gardens, bioretention facilities, vegetated rooftops, infiltration trenches, dispersion systems, and rainwater harvesting. These types of LID solutions are described in Volume V, Section 5.3.1 of the 2005 Ecology Manual. Applications, limitations and design guidelines are also provided. The 2012 Low Impact Development Technical Guidance Manual for Puget Sound provides additional information related to LID BMPs.

To determine if LID applications can be used for a project or area, the site soils need to be evaluated. The NRCS has made available soil surveys which provide detailed soil reports including engineering properties, such as typical soil types, soil gradation, and infiltration rates. For future development and redevelopment within the City of Snohomish, an LID feasibility map was prepared for the areas within each basin, see Figure 2. Soil information based on the NRCS Survey for Snohomish County (see Section 3.3) was referenced. Soil types listed from the soil survey were evaluated for their overall suitability for LID implementation. For this evaluation, suitability was based on the four hydrologic soil groups that have been established by NRCS.

Soils are classified into hydrologic soil groups to indicate the minimum rate of infiltration obtained for bare soil after prolonged wetting. The infiltration rate is controlled by the surface conditions and is the rate at which water enters the soils surface. There are four hydrologic soil group, which are A, B, C and D. The four groups are defined as follows:

- Group A soils have low runoff potential and high infiltration rates even when thoroughly wetted. The infiltration rates for these soils are greater than 0.3 inches per hour. These soils consist of well to excessively drained sands or gravels.
- Group B soils have moderate infiltration rates when thoroughly wetted. Infiltration rates for these soils are 0.15 to 0.3 inches per hour. These soils consist of moderately well to well drained soils with moderately fine to moderately coarse textures with moderately slow to moderately rapid permeability.
- Group C soils have low infiltration rates and consist of soil with a layer that impedes downward movement of water. Group C soils have an infiltration rate of 0.05 to 0.15 inches per hour and consist of soils with moderately fine to fine texture.
- Group D soils have high runoff potential and very low infiltration rates. The infiltration rate is approximately 0 to 0.05 inches per hour. Soils in this group could be due to a high water table that creates a drainage problem. These soils consist of clay soils with high swelling potential, soils with a permanent high water table, soils with a claypan or clay layer at the surface, and shallow soils over nearly impervious material.

The texture and structure of the soil as well as vegetation impact the rate of which the infiltration occurs. Soil groups A through D range in infiltration rates. Gravel and sandy material allow for the most infiltration. These soil types have large pore sizes which allow water to move quicker between the soils. Vegetation also increases the infiltration by making the soil more porous. Clay soils have the lowest infiltration rates due to its small pores and impermeable properties. The infiltration is slow or fully prevented and the water is forced to runoff.

An important design element for an LID practice is the depth from the base of the LID measure to seasonal groundwater, because LID promotes infiltration of stormwater. If there is a high groundwater table, surface water will not be allowed to infiltrate regardless of soil conditions.

Figure 2: Soil Type Suitability for Low Impact Development was developed as an initial screening tool to evaluate soil type and typical infiltration rates to help determine if soils in a particular area might be suitable for LID. In general, the higher the infiltration rate, the more suitable the soil is for LID. This map should be used for planning purposes; guidance on how to determine infiltration rates for design purposes can be found in the LID Technical Guidance Manual (Puget Sound Partnership 2012). LID design guidance and field investigation requirements for development and redevelopment are also provided in the 2005 Ecology Manual.

6.0 PROBLEM IDENTIFICATION AND SOLUTION DEVELOPMENT

6.1 GENERAL

This section describes conveyance system related surface water problems in the study area, the methodology used to identify them, and the alternative solutions.

Conveyance system problems include occurrences such as flooding, channel erosion, and damaged or substandard storm drainage systems. System problems such as flooding and channel erosion may be the result of:

- Uncontrolled runoff from developed areas.
- Inadequate channel or pipe capacities or material failures in existing storm drainage systems.
- The loss of flood reducing storage capacity in natural depressions and riparian areas.

The locations of the conveyance system problems identified for this Plan are shown in Figure 1: Basin Map.

6.2 PROBLEM IDENTIFICATION METHODOLOGY

Developing a comprehensive summary of stormwater problems in the study area involved a combination of conducting a public meeting, several meetings with City staff, field observations, and technical analysis. Detailed descriptions of the information sources used and technical investigations performed are described in the following paragraphs.

6.2.1 Public Input

The public meeting held to solicit input from the public related to drainage problems was advertised in a notice posted in the Everett Herald on two occasions, each one and two weeks prior to the public meeting, on the City's website, and in the City Manager's newsletter. The meeting was also advertised by posting flyers at City Hall, City Engineering Office, and the City Library.

The notice and flyers described the stormwater comprehensive plan update and requested individuals to attend a public meeting, November 27th, 2012, to help identify existing drainage problems. Problem identification input forms were available at the public meeting for the participants to use to help identify problems. Several maps were also presented at the Public meeting illustrating known existing problems and potential solutions.

6.2.2 Input from City Staff

Both the City engineering staff and the maintenance personnel provided input on problems. City staff provided input on the type, size and condition of existing systems; knowledge of historical flooding; and feedback on practical and cost-effective solutions.

6.3 STORMWATER PROBLEM AREAS

6.3.1 Area C-1: 87th Avenue SE (Sinclair Avenue)

During heavy rainfall events water ponds on the right of way and private property at the northeast corner of the intersection. Surface water runoff from 87th Avenue SE and properties located north of 50th Street and along the east side of 87th Avenue drains into the 87th Avenue frontage ditch. The ditch slopes north to south and terminates at the northeast corner of the intersection. Water from the ditch enters a 12-inch culvert and empties into a ditch on the west side of 87th Avenue. The east end of the culvert is approximately 6 inches higher than the west end. From the west end of the culvert, the ditch extends westward approximately 30 to 50 feet before turning south. The ditch meanders south and terminates in a small basin located at the northwest corner on 87th Avenue SE and Bickford Avenue. From this location storm water flows south along Bickford Avenue through a series of culverts and ditches (see Figure C-1).

As reported by City staff, it appears that stormwater runoff from two commercial properties located west of 87th Avenue SE is trenched to the existing west side ditch paralleling 87th Avenue SE. The trench terminates at the west end of the 87th Avenue culvert. It is not known if the existing west side ditch was intended or checked to see if it could accommodate the runoff from the two commercial properties.

6.3.2 Area C-2: Swifty Creek (at Second Street)

Swifty Creek begins at the outlet from Blackmans Lake and flows through a series of open channels, culverts, and pipelines to a diversion structure at Maple Avenue and Sixth Street (Freshman Campus). The diversion structure diverts low flows and a majority of high flows to the Pilchuck River, via a pipeline. The diversion structure does allow some overflows into Swifty Creek. From the diversion structure, Swifty Creek flows through a combination of open channels, pipelines, and culverts before discharging into the Snohomish River.

The downstream-most segment of Swifty Creek is conveyed within a series of storm drain pipes. The 24-inch diameter pipeline begins approximately 150 feet north of Second Street, behind the AA Rental property (between Union and Cedar Avenues) and ends at the Snohomish River. The pipeline is approximately 1,300 feet long and the majority of the pipeline is located under private property. Due to poor pipe condition and/or partial pipe blockage, flow in the pipeline backs up creating a deep backwater pond at the pipeline entrance. Backwater conditions occur during wet and dry conditions, indicating groundwater infiltration into the open sections of Swifty Creek.

The City has made several attempts to inspect the pipeline via closed circuit televising. The first attempt started at a manhole located approximately in the middle of the pipeline and on private property, near Pearl Street. Due to rock and debris within the pipeline, the City was unable to video the pipeline in the northern direction. The second attempt was made from a manhole located downstream of First Avenue, near the Snohomish River. The manhole was located on City property. The City was able to video the pipeline to the north, until reaching the manhole near Pearl Street. At this point the video camera was unable to proceed because of the rock and debris in the pipeline. The video of this section indicated fractures in the pipe. Since the majority of the pipeline access manholes are located on private property and adequate space for vehicles and cleaning equipment is not available, the City is not able to maintain sections of the pipeline. In areas where the City has adequate access, periodic removal of large woody debris and tires has occurred near the pipeline entrance. Since a majority of the pipeline is located under private property, including buildings, inspection, maintenance, repair or replacement of damaged pipe sections is not feasible (see Figure C-2).

6.3.3 Area C-3: Maple Avenue (Unopened Fairview Street)

A small ditch approximately 100 feet long receives stormwater runoff from the upper Suncrest Drive, via a pipeline, and the adjacent hillside to the north. The ditch is located on the north side of the unopened Fairview Street. The street intersects with Maple Avenue and is approximately 270 feet long. The street slopes toward Maple Avenue, with a slope of about 16 percent. The street surface is gravel and rock. The lower portion of the street provides access to a single family residence while the upper section provides access for the City to maintain the ditch and storm drain system.

Stormwater in the ditch enters a driveway culvert and flows through a series of small ponds and connecting culverts on private property before entering a final pipe section that connects to the existing storm drain manhole in Maple Avenue. During high stormwater runoff events, water flow in the ditch backs up and overflows the ditch at the upstream end of the driveway culvert. It appears that the private pond/culvert system is inadequate to accommodate all of the ditch flow during large storm events. The ditch overflow sheet flows down the gravel and rock street surface, eroding the street surface and depositing gravel, rock, and fine particle material on the sidewalk and Maple Avenue (see Figure C-3).

6.3.4 Area C-4: Park Avenue/Blackmans Lake

Stormwater runoff from Park Avenue and adjacent properties empty into the roadside ditches along Park Avenue. The west side ditch, north of 19th Street, enters a culvert crossing 19th Street at Park Avenue. The culvert ends at a catch basin located at the southwest corner of Park Avenue and 19th Street. From the catch basin a 12 inch storm drain pipeline continues south within Park Avenue right of way for approximately 175 feet and terminates at a manhole. A 36 inch pipeline extends from the manhole and ends at Blackmans Lake (see Figure C-4).

During large storm events, stormwater flow from the roadside ditch exceeds the capacity of the 12 inch pipeline. As a result, stormwater backs up in the catch basin and exits the grated top. The released stormwater sheet flows in a southwesterly direction and onto private property. On at least one occasion, stormwater entered a garage.

6.3.5 Area C-5: Two problems: 16th Street and Holly Vista Drive

Area 5a: 16th Street. There is currently no storm drainage system along 16th Street, from Pine Avenue to Terrace Avenue. During large storm events, stormwater ponds within the right of way and approaches private properties (see Figure C-5a).

Area C-5b: Holly Vista Drive. Originally, stormwater collection and conveyance along Holly Vista Drive was provided by open ditches. Over time, a number of the ditches were filled by private homeowners. Currently, there is no storm drainage system along Holly Vista Drive. Several open ditch sections remain but there is no outlet for the ditch sections. Stormwater runoff is via sheet flow from the northeast to the southwest direction. Runoff crosses Holly Vista Drive and sheet flows across residential properties located along the west side of Holly Vista Drive (see Figure C-5b).

6.3.6 Area C-6: Cypress Avenue

Extending north from Fourth Street, Cypress Avenue ends at a private roadway for several homes. Three shallow catch basins located near the north end of Cypress Avenue drain to a catch basin in the private roadway. From the private catch basin stormwater is routed to the west towards an adjacent private property. The route of the storm drain pipeline from the private catch basin is unknown but the City believes it eventually connects into the storm drain main located along Pine Avenue (see Figure C-6).

During heavy or prolonged storm events the catch basin in the private roadway clogs with debris and causes the catch basins in Cypress Avenue to overflow. The overflow runoff flows onto private property. City maintenance crews clean the private catch basin to relieve the overflow problem in the City catch basins on Cypress Avenue.

6.3.7 Area C-7: Third Street and Avenue D

The gutter catch basin located at the northeast corner of Third Street and Avenue D does not drain properly due to the poor condition of the storm drain pipe from the catch basin. Stormwater runoff backs up in the catch basin and ponds in the roadway intersection. Age and tree roots from a nearby tree has compromised the integrity of the storm drain pipe (see Figure C-7).

6.3.8 Area C-8: Grove Street

There is no stormwater collection system along Grove Street. The south side of Grove Street has concrete curb, but the north side does not. Stormwater flows more readily along the south side gutter to the catch basins located on Lincoln Avenue. Stormwater ponding occurs in areas along the street edge and in the right of way near private property. One area in particular is the property located at the southwest corner of Grove Street and Lincoln Avenue. Water ponds behind the recessed driveway curb and approaches the private property during storm events (see Figure C-8).

6.3.9 Area C-9: Baird and Victor Avenues

There is no stormwater collection system along Victor and Baird Avenues. Water ponds within the paved streets. Several properties along both avenues are at or below street grade and during large rain events runoff from the roads flow towards these properties (see Figure C-9).

6.3.10 Area C-10: Short and Long Streets

There is no stormwater collection system along Short and Long Streets. The streets and surrounding area is basically flat and does not promote natural or positive drainage. Water ponds along the streets and the right of way areas. Another factor impacting drainage along Short Street is Short Street is not paved. Small to moderate potholes form in the gravel street and trap stormwater (see Figure C-10).

6.3.11 Area C-11: Bonneville Avenue

There are two areas of water ponding along Bonneville Avenue near Bickford Avenue. Both ponding areas are in driveways at the entrance to Bonneville Avenue. One driveway is for a private residence and the other is for a commercial property (see Figure C-11).

6.3.12 Area C-12: Blackmans Lake Outlet Control Project

Properties adjacent to Blackmans Lake have experienced flooding problems due to the variations of the lake water level. Silt accumulation and vegetation growth in the outlet channel (Swift Creek) has restricted the discharge from the lake which results in rising water levels during storm events. The outlet channel is located at the south end of the lake. Discharge water from the lake also flows through a series of culverts which have decreased in capacity due to sediment accumulation. There is also a series of culverts which have decreased in capacity due to sediment accumulation causing backwater to occur.

6.4 HYDROLOGIC AND HYDRAULIC ANALYSIS

Overall hydrologic and hydraulic computer analysis for the planning area is described in Chapter 4. This section describes stormwater modeling conducted for several problem areas. Solutions for smaller problem areas were estimated. The specific problem areas that underwent hydrologic and hydraulic modeling are listed below (see Appendix D for calculations):

- Area C-1: 87th Avenue SE (Sinclair Avenue)
- Area C-3: Maple Avenue (Unopened Fairview Street)
- Area C-4: Park Avenue/Blackmans Lake
- Area C-5: 16th Street and Holly Vista Drive

The majority of the stormwater problems in the City are conveyance related and result in ponding or flooding of stormwater that have led to concerns of public safety, flooding of private property, water quality, and the need for additional operation and maintenance to inspect, maintain/unplug, and repair City infrastructure.

There are several stormwater conveyance pipes within the storm drainage system that have been identified for upgrades. The larger basin map shown on Figure 1 identifies the 12 projects that have been identified by City staff and the public. Conveyance related issues were evaluated in a similar manner.

The existing land use designations from the 2011 City Land Use Map (City of Snohomish 2010) and the 2012 land use designations from the Snohomish County’s comprehensive plan (Snohomish County 2012) were used in ARCGIS to identify the land use designation for each problem area. Single family residential land use was assumed to be multifamily, 50% pervious and 50% impervious (Taylor, 1993). The areas analyzed were mostly developed and may fall under high density residential land use. The pervious portions were assumed to be in good condition with grass cover on more than 75% of the area, resulting in a curve number of 86. The right-of-way area was assumed to be paved, with a curve number of 98.

The Engineering Design and Construction Standards (City of Snohomish 2004) requires new conveyance elements to be sized for 25-year, 24-hour storm and checked for 100-year storm to verify that excessive erosion or flooding does not occur. New stormwater conveyance pipes were sized by computing the peak flow resulting from 24-hour duration, 25- and 100-year recurrence interval storms, using the Santa Barbara Unit Hydrograph (SBUH) method.

The land use areas estimated in ARCGIS were separated into pervious and impervious areas for input into SBUH spreadsheet. A Type 1A unit hydrograph was used, appropriate for Western Washington. The precipitation for the 2-, 25- and 100-year storm events was determined by using NOAA Atlas 2 isopluvial maps. Time of concentration was estimated using methodology defined in TR-55 (USDA NRCS Technical Release 55).

Bentley Systems, Inc. FlowMaster, 2008 software was used to size new pipes, based on the peak 25-year 24-hour storm. The pipes were graded so that they can gravity drain to the connection point. Slopes were based on the existing topography as provided by the available data in GIS. Systems were checked using the 100-year peak flow to evaluate the proposed solution for flooding or erosion.

Modeling was conducted for the Blackmans Lake Outlet Control Project and is described in the document entitled, “Blackmans Lake Level Evaluation; Summary of Outlet Analysis”, (Tetra Tech 2008).

6.5 PROBLEM AREA IMPROVEMENT RECOMMENDATIONS

Recommended improvements are described in the following subsections. Projects were evaluated and compared based on several categories, including potential impacts to wetlands, challenges with easement

acquisition, potential impacts to fish/wildlife habitat and water quality, constructability, operation and maintenance, perception of public acceptance, ability to obtain permits. A project summary sheet including overall score and estimated costs is included in Appendix A. Construction costs were estimated and are presented in Appendix B. Table 6-1: Proposed Drainage Improvements includes a summary for each project.

6.5.1 Area C-1: 87th Avenue SE (Sinclair Avenue)

In order to alleviate the ponding problem at the northeast corner of 87th Avenue SE and 50th Street, approximately 400 linear feet of 12- to 16-inch diameter storm drain pipeline would be installed from the outlet end of the culvert crossing 87th Avenue SE to the storm drain conveyance system along Bickford Avenue. The pipeline can be installed along the west shoulder of 87th Avenue SE. Eliminating the runoff from businesses located west of 87th Avenue SE from accessing the culvert crossing 87th Avenue SE is needed to control flooding within the ROW and to nearby private property. The access ditch would be redirected and runoff from the west properties would utilize an existing ditch that empties into the Bickford Avenue drainage system (see Figure C-1). This recommended improvement would restore the public stormwater system that historically flowed to Bickford Avenue.

6.5.2 Area C-2: Swifty Creek (at Second Street)

The repair or replacement of the existing 24-inch Swifty Creek storm drain pipeline from Second Street to a manhole located south of the intersection of First Street and Union Avenue is not feasible because a majority of the pipeline is on private property. A new pipeline within city right of way and an acquired easement could be constructed. The easement would need to be secured for approximately the first 180 to 200 linear feet of pipeline to cross one private property adjacent to Second Street. The remaining 800 linear feet or so of pipeline would be constructed along Glen and Union Avenues and crossing First and Second Streets. The lower end of the new pipeline would connect into an existing 60-inch manhole, where the existing 24-inch pipeline extends to the Snohomish River. The existing 24-inch pipeline would be plugged at the Swifty Creek end and at the existing 60-inch manhole. Approximately 4 new manholes would be installed at horizontal bends along the pipeline route (see Figure C-2). Additional catch basins would be installed along Union Avenue, between First and Second Streets, which would empty into the proposed storm drain pipeline. The additional catch basins would improve drainage along Union Avenue. Also, existing catch basins along Glen Avenue would be removed from the combined sewer system and connected into the new pipeline.

6.5.3 Area C-3: Maple Avenue (Unopened Fairview Street)

The largest contributor to the ditch overloading and subsequent overflow along the unopened section of Fairview Street is the storm drain system from the Suncrest Drive neighborhood. To remove this runoff load from the ditch, a new 12-inch storm drain pipeline would be installed to bypass the ditch and empty directly into the storm main located in Maple Avenue. The pipeline, approximately 280 linear feet, would originate at the existing receiving manhole for the Suncrest Avenue neighborhood runoff and discharge into the Maple Avenue storm main, via a new manhole. The new pipeline would be installed within the unopened gravel Fairview Street right of way (see Figure C-3).

6.5.4 Area C-4: Park Avenue/Blackmans Lake

The existing 12-inch storm drain pipeline, from the catch basin located at the southwest corner of Park Avenue and 19th Street to the Blackmans Lake inlet manhole, would be replaced with a 24-inch pipeline. The replacement pipeline would be approximately 180 feet in length. The existing catch basin and manhole would be replaced if they were determined to be undersized (see Figure C-4).

6.5.5 Area C-5: Two projects: 16th Street and Holly Vista Drive

Area C-5a: 16th Street. A stormwater collection and conveyance system would be installed along 16th Street, from Terrace Avenue to Pine Avenue. The system would consist of approximately 6 to 8 properly

located catch basins along both sides of the roadway and a 12-inch storm drain pipeline (approximately 285 feet in length) that would receive stormwater from the catch basins. The pipeline would empty into the Pine Avenue roadway ditch (see Figure C-5a).

Area C-5b: Holly Vista Drive. The drainage improvements associated with Holly Vista Drive can be divided into three sections:

- Holly Vista Drive (north of 16th Street) and 16th Street (between Terrace Avenue and Holly Vista Drive),
- Holly Vista Drive (south of 16th Street), and
- Unopened Terrace Avenue (from 15th Street/Suncrest Drive to 16th Street)

Improvements along Holly Vista Drive north and 16th Street would involve constructing a 12- to 18-inch storm drain pipeline along the west shoulder of Holly Vista Drive. This pipeline section would be approximately 550 feet in length. The pipeline would turn west on 16th street and extend approximately 75 feet to an existing manhole at Terrace Avenue. Approximately 9 to 12 catch basins and 2 to 3 storm manholes would be installed. Stormwater collected in the new system would flow through a series of existing ditches and pipes to the proposed stormwater improvements for the unopened Terrace Avenue.

The Holly Vista Drive south improvement section would involve constructing a 12- to 18-inch storm drain pipeline along the west shoulder of Holly Vista Drive for approximately 180 feet to the cul-de-sac at the south end of Holly Vista Drive. From the cul-de-sac, the pipeline would extend southwest through a platted utility easement approximately 170 feet, to an existing storm drain manhole located on Suncrest Drive. The 170-foot pipe section would be installed within an existing city easement. Approximately 4 to 6 catch basins and 2 to 3 storm drain manholes would be installed.

The improvements along the unopened section of Terrace Avenue would involve installing approximately 430 linear feet of 12- to 18-inch storm drain pipeline from an existing manhole on 16th Street to an existing storm manhole on Suncrest Drive. Prior to reaching the manhole on Suncrest Drive the storm drain pipeline would enter an approximate 8-foot diameter by 100-foot long pipe detention vault and exit the vault to the manhole. The detention vault would be needed to control the additional flow from the Holly Vista Drive area to the existing stormwater drainage system downstream of the manhole and prevent overloading of the existing system. Stormwater from this area would enter the drainage system improvements for Area C-3 (Maple Avenue Washout Area) and empty into the 12 inch stormwater main located on Maple Avenue. The Suncrest drive manhole would be same manhole utilized by the storm drain pipeline for the Holly Vista Drive south section. Also, the existing storm drain outlet for Terrace Avenue to an existing ditch extending along the unopened Terrace Avenue road section would be removed. Terrace Avenue drainage would flow through the new storm drain pipeline. The unopened Terrace Avenue section is cleared and covered with grass and weeds (see Figure C-5b).

6.5.6 Area C-6: Cypress Avenue

Three existing shallow catch basins on the north end of Cypress Avenue drain to a common catch basin located in a private road. The private catch basin is not properly maintained and plugs periodically. The proper operation of the Cypress Avenue catch basins is dependent on the private catch basin.

On the south end of Cypress Avenue, six shallow catch basins drain into the existing CSO pipeline that extends north/south along Cypress Avenue. To improve drainage and eliminate the maintenance issues associated with the three north end catch basins, replacing the catch basins with larger and deeper ones and installing new pipelines are proposed. The catch basin flows would be redirected and connected into the five catch basin system that drains into the CSO pipeline. The proposed solution is presented on Figure C-6.

The improvements would drain additional water into the CSO system. Two other options were considered that would not place additional stormwater flows into the CSO system but they were not feasible. One option was to reroute the flow from the three north catch basins, via a pipeline, to the existing storm main located at Fourth Street and Pine Avenue. Due to the shallow depth of the Pine Avenue storm main (approximately 4 feet) and Pine Avenue being approximately 12 to 18 inches higher than Cypress Avenue, a proper slope or grade would not be achievable for the new pipeline. The second option was to create a new stormwater outfall to the Pilchuck River at the east end of Fourth Street and reroute the flow from the north catch basins to the outfall. This option was not selected based on the following environmental constraints: the slope from the end of Fourth Street down to the river is very steep and potentially unstable; wetland impacts along the toe of the slope may occur by extending an outfall to the river; and the river is regulated under the Endangered Species Act.

6.5.7 Area C-7: Third Street and Avenue D

Age and tree roots have impacted the flow through a storm drain pipe that services the northeast gutter catch basin at the intersection of Avenue D and Third Street. The existing pipe section would be replaced with a 12-inch pipe. The pipe would be cased inside of a steel casing pipe. The casing pipe would protect the carrier pipe from tree roots (see Figure C-7).

6.5.8 Area C-8: Grove Street

A stormwater collection and conveyance system would be installed along Grove Street, from Lincoln Avenue to Pine Avenue. The system would consist of approximately 6 to 8 properly located catch basins along both sides of the roadway and a 12- to 15-inch storm drain pipeline (approximately 300 feet in length) that would receive stormwater from the catch basins. The pipeline would empty into the Lincoln Avenue storm main, via a new manhole (see Figure C-8).

6.5.9 Area C-9: Baird and Victor Avenues

A stormwater collection and conveyance system would be installed along Baird and Victor Avenues, from Seventh Street to Eighth Street. The combined system would consist of approximately 16 to 18 properly located catch basins along both sides of the roadways, 12- to 15-inch storm drain pipelines (approximately 800 feet in length), and two manholes at the connection location of the new storm pipelines to the existing 30 inch storm main located in Seventh Street (see Figure C-9).

6.5.10 Area C-10: Short and Long Streets

A stormwater collection and conveyance system would be installed along Short and Long Streets, from Mill Avenue. The combined system would consist of approximately 18 to 20 properly located catch basins along both sides of the roadways, 12- to 15-inch storm drain pipelines (approximately 900 feet in length), and two connections at existing catch basins in Mill Avenue. Since Short Street is not paved the final lift of the trench backfill would consist of 4 inches of crushed surfacing base course material. The street may be paved at a future under the City's paving program or as part of the Transportation Benefit District. (see Figure C-10).

6.5.11 Area C-11: Bonneville Avenue

A catch basin would be installed at the driveway low point within the road right of way. Water collected by the catch basins would empty into the existing storm main located across the street via a 12" to 15" inch pipe (see Figure C-11).

6.5.12 Area C-12: Blackmans Lake Outlet Control Project

The Blackmans Lake Level Evaluation; Summary of Outlet Analysis (Tetra Tech 2008) describes the analysis that was completed to develop the proposed improvements to resolve the flooding issue. The

improvements consist of the installation of a weir to control the lake level, channel improvements including sediment removal, culvert replacement and culvert sediment removal. Estimated project cost is \$528,000 (Tetra Tech 2008). Design of the improvements is currently underway.

Table 6-1 Proposed Drainage Improvements

Project	Location	Problem	Proposed Improvement	Estimated Cost	Overall Score ¹
C-1	87 th Avenue SE (Sinclair Avenue)	Flooding at intersection of 50 th Street and Sinclair Ave. Flood water approaches private property.	Construct new storm drain pipeline along 87th Avenue from 50th Street to Bickford Avenue.	\$78,000	20
C-2	Swiftly Creek (at Second Street)	Damaged/obstructed existing storm drain pipeline located in private property. Safety and flooding is of concern for adjacent properties.	Construct a new pipeline within City right of way along Glen and Union Avenues, from Second St. to First St.	\$468,000	51
C-3	Maple Avenue (Unopened Fairview Street)	Undersized ditch on private property overflows down the gravel surfaced Fairview Drive and causes erosion and sedimentation. Safety, flooding of private property, and maintenance concerns.	Construct a 12-inch storm drain pipeline from the ditch to the existing storm main located in Maple Avenue.	\$60,000	15
C-4	Park Avenue/Blackmans Lake	Undersized storm drainage pipeline backs up and causes flooding of private property.	Replace the existing 12" storm drain pipeline with a 24" pipeline.	\$62,000	15
C-5a	16 th Street	There is no drainage system on this section of 16 th Street. Flooding of private property is of concern.	Construct catch basins and 12" storm drain lines; connect to the roadside ditch along Pine Ave.	\$122,000	17
C-5b	Holly Vista Drive	There is no drainage system along Holly Vista Drive. Flooding of private property is of concern.	Construct catch basins and 12" storm drain lines; connect to existing storm manhole on Suncrest Dr. Provide detention system due to limited downstream conveyance capacity.	\$394,000	19
C-6	Cypress Avenue	The north end of Cypress Ave. drains to a private catch basin that plugs and requires maintenance. Flooding of private property is of concern.	Reroute storm flows south to existing storm main that connects to a CSO pipeline on Cypress Ave.	\$77,000	17
C-7	Third Street and Avenue D	Stormwater ponds at this intersection because a pipe is damaged/obstructed by tree roots.	Replace with steel-cased pipe.	\$14,000	15
C-8	Grove Street	There is no drainage system along Grove Street. Flooding of private property is of concern.	Construct catch basins and a 12" to 15" storm pipeline; connect to the existing storm main located on Lincoln Avenue.	\$89,000	15
C-9	Baird and Victor Avenues	There is no drainage system along Baird and Victor Avenues. Flooding of private property is of concern.	Construct catch basins and a 12" to 15" storm pipeline that would tie into the existing storm main on 7th Street.	\$234,000	15
C-10	Short and Long Streets	There is no drainage system along Short and Long Streets. Short Street is not paved and has several potholes. Flooding of private property and maintenance concerns.	Construct catch basins and a 12" to 15" storm pipeline; connect to existing storm main on Mill Avenue	\$224,000	15
C-11	Bonneville Avenue	Water ponds in residential and commercial business driveways. Flooding concerns on private property.	Install new catch basin and connect to existing storm main across the street.	\$10,000	18
C-12	Blackmans Lake Outfall Control Project	Sediments and/or vegetation partially blocking Lake outlet system (channel and culverts) and causing flooding of lakeside homes during storm events.	Remove the sediments and vegetation and replace old or damaged culverts.	\$528,000	NA

¹ See Appendix A

7.0 SEPARATED STORM DRAINAGE SYSTEM FOR THE COMBINED SEWER AREA

7.1 GENERAL

The combined-sewer area in the City of Snohomish is located in the downtown historic district, in the south-southwest portion of the City. All sanitary sewer (sewer) pipelines in the combined-sewer area receive and convey sewer and stormwater flows. Contributors of stormwater flow include roof drains, plumbing drains, and storm drains (catch basins and inlets) along roadways. The combined-sewer area is approximately 248 (see Table 3-1) acres and is roughly bordered by First Street to the south, State trail on the southeast, Glen Avenue to the east, Fifth to Sixth Streets along the north, and State Route 9 to the west (see Figure 3).

The combined-sewer area is divided into two sub-basins, the gravity basin and the pump station basin (see Figure 4).

The sewer lines in the gravity basin empty into a sewer main located in Second Street, which extends west along Second Street, and terminates at the wastewater treatment plant. A combined-sewer overflow is associated with this basin. The overflow consists of a manhole and an 18" overflow pipe from the manhole to the Snohomish River. The manhole is located at Second Street and Avenue H. If the flow capacity of the sewer main is exceeded during large storm events, flow backs up into the manhole. Once the water level in the manhole reaches the overflow pipe invert, flow is diverted through the overflow pipe to the Snohomish River. This combined sewer overflow location is labeled CSO #1 on Figure 3.

A combined-sewer overflow is also associated with the pump station basin. The overflow consists of a manhole and a 24-inch diameter overflow pipe from the manhole to the Snohomish River. The overflow concept is similar to the gravity basin overflow. The manhole is located at Avenue E and First Street. This combined sewer overflow location is labeled CSO #2 on Figure 3.

In 2010-2011, improvements to the two combined-sewer sub-basins were constructed under the CSO Reduction Project. The improvements included:

- A new sanitary sewer/stormwater pump station was constructed to replace the original pump station, Pump Station No. 1, for the pump station basin. The new pump station is located at the City Shop site on First Street.
- New combined sewer main along Second Street, from Avenue H to the Wastewater Treatment Facility (WWTF).
- New sewer and storm water forcemain from the new pump station to the WWTF.
- A 30 inch stormwater main installed along Second Street, from Avenue H to the WWTF entrance. This pipeline was installed to accommodate stormwater flows for future CSO separation projects.

This project was constructed to provide additional combined-sewer flow capacity, increase pumping capacity, reduce CSO events, and provide a dedicated stormwater main to the treatment plant located on the west side of State Route 9. The future CSO separation projects would utilize the former wastewater lagoon at the WWTF as a stormwater quality treatment basin.

7.2 OPPORTUNITIES FOR CSO SEPARATION

As part of this stormwater comprehensive plan update project, the City requested that a potential CSO separation project be evaluated. The evaluation area is from Second Street to Fifth Street and Avenue E to Avenue L. The project would address disconnecting existing catch basins from sewer pipelines and reconnecting them to a new stormwater pipeline. The new stormwater pipelines would empty into the 30" storm main on Second Street. The project would also extend the 30" storm main to the former wastewater lagoon at the WWTF (See Figure C-12). The former wastewater lagoon is approximately 30 acres in size and would be converted to a stormwater quality treatment pond.

The lagoon has been closed to receiving wastewater and has been revegetated. Currently, thick vegetation covers the surface of the lagoon. A low point in the existing dike system around the lagoon, located in the southwest corner, allows high flows from the Snohomish River to enter the lagoon during flood events and allows water within the pond to discharge back to the river.

7.2.1 Water Quality Treatment Facility Options

There are two possible water quality treatment facility designs that could be implemented, including a stormwater wetpond or a stormwater treatment wetland. Design criteria for these two types of facilities are included in the Ecology Manual, Volume V: Runoff Treatment BMPs, Chapter 10 – Wetpool Facilities (Ecology 2005).

A wetpond is a constructed stormwater pond that retains a permanent pool of water at least during the wet season. The volume of the wetpool is related to the effectiveness of the pond in settling particulate pollutants. Peak flow control (detention) can be provided in the “live storage” area above the permanent pool.

There are two types of wetponds, basic and large. For the basic wetpond, the designed wetpool volume shall be equal to or greater than the total volume of runoff from the water quality design storm (the 6-month, 24-hour storm event). Alternatively, the design volume can be calculated based on the 91st percentile, 24-hour runoff volume indicated by an Ecology-approved continuous runoff model such as WWHM, HSPF, or MGS Flood. Large wetponds are designed for higher levels of pollutant removal. A large wetpond requires a wetpool volume at least 1.5 times larger than the total volume of runoff from the 6-month, 24-hour storm.

Wetpond design criteria includes the following:

- Two cells (with the first cell 25% to 35% of the wetpool volume).
- A berm or baffle separating the two cells.
- Access road and ramp to the first cell for cleaning and maintenance.
- Energy dissipation at the pond inlet.
- Large length to width ratio (wetpool flow length at least 3 times the width).
- Maximized flow length between the inlet and outlet to enhance treatment.
- Minimum depth of the first cell of 4 feet.
- Outlet control structure and emergency spillway.

A stormwater treatment wetland is a shallow man-made pond that is designed to treat stormwater through the biological process associated with emergent aquatic plants. Stormwater treatment wetlands are used to capture and transform pollutants, just as wetponds are, and over time pollutants will concentrate in the

sediment. Therefore, the facility would require maintenance including occasional harvesting of vegetation and sediment dredging from the facility.

A stormwater wetland design occupies about the same surface area as a wetpond, but has the potential to be better integrated aesthetically into a site because of the abundance of emergent aquatic vegetation. The most critical factor for a successful design is the provision of an adequate supply of water for most of the year. Careful planning is needed to be sure sufficient water will be retained to sustain good wetland plant growth. Since water depths are shallower than in wetponds, water loss by evaporation is an important concern. Stormwater wetlands are appropriate for areas with higher winter groundwater levels.

Stormwater treatment wetland design criteria include the following:

- Two cells (with the first cell 33% of the wetpool volume).
- A berm separating the two cells.
- Access road and ramp to the first cell for cleaning and maintenance.
- Energy Dissipation at the inlet to the first cell.
- The second cell or “wetland cell” shall have an average depth of about 1.5 feet and a maximum depth of 2.5 feet.
- Wetland cell can be uniformly graded or graded with a more natural sinuosity.
- The surface area of the stormwater treatment wetland shall be the same as the top area of a wetpond sized for the same site conditions.
- Minimum depth of the first cell of 4 feet.
- Outlet control structure and emergency spillway.

The selection of a wetpond (basic or large) versus a stormwater treatment wetland should be based on a site specific evaluation. Considerations for this facility should include the water quality of the inflowing stormwater. Another key consideration is the amount of operation and maintenance involved. A stormwater treatment wetland will rely on plant health more than a wetpond and periodically the plants will need to be removed and replanted.

Whether a stormwater treatment wetland or a wetpond is preferred, the existing pond facility should undergo a physical survey and inspection. The existing pond embankments and overflow from the pond should be observed to make sure the facility has adequate slope stability and erosion protection.

Another consideration during planning and design of the facility is to evaluate permit considerations related to the former wastewater lagoon. It is understood that the lagoon was closed several years ago. Documentation associated with closure should be reviewed to determine if there are any restrictions on redeveloping the pond into a stormwater treatment facility. Because the pond is presently open to the river for flood storage, use of the pond for treating stormwater from smaller rain events appears feasible.

7.2.2 Water Quality Treatment Design Storm

A preliminary hydrologic evaluation was completed to estimate the water quality design volume for a basic wetpond. Supporting documents and calculations are provided in Appendix D. The area from the Combined Sewer Overflow drainage area (approximately 248 acres) was modeled using WWHM. Land use characteristics used in modeling are described in Section 3.4. Based on existing zoning, the wetpool design volume was estimated to be approximately 23 acre-feet. It is assumed that the pond would be designed as an on-line pond with stormwater routed directly to the facility. Flows higher than the design storm event would be allowed to overtop through the existing spillway and discharge to the river. The 15-minute design flow rate for an on-line facility is 32.2 cfs. A design option could be to use a piped

high-flow bypass, which would result in a 15-minute design flow rate of 18.3 cfs. A high-flow bypass would add additional cost and is likely not necessary; thus, was not included.

Based on the BMPs employed by the City and Snohomish County within the study area, it is assumed that the water quality of the separated stormwater would be adequately treated in a basic wetpond, approximately 23 acres.

Future changes in zoning and land use were evaluated to determine the wetpond volume needed for a complete build-out of the 248 acre Combined Sewer Area. Assuming 100 percent impervious area, the wetpond volume would increase to 30 acre-feet.

If deemed necessary during the design phase, an influent water quality evaluation would help determine if a basic or large wetpond or treatment wetland is preferred. A large wetpond would require a wetpool size of 45 acre-feet (based on the future zoning assumption of 100% impervious area). The proposed facility design will need to allow room for sediment storage and freeboard. Per Ecology requirements, the first cell requires 1 foot of sediment storage. Freeboard will vary based on the design, but a minimum of 1 foot of freeboard should be considered during design.

The existing pond was observed during a recent site visit and it appears that the pond is approximately 30 acres in plan with a depth of approximately nine feet deep. Based on the size available, it appears that a stormwater wetpond or treatment wetland would fit within the existing foot print. The first cell may require excavation into the existing pond bottom to achieve the minimum required depth based on Ecology requirements.

Inlet and outlet control structures will be required depending on the design. An evaluation of the existing vegetation and vegetation needed for optimal stormwater treatment is also recommended.

Section 3.7 also describes known wetlands in the vicinity of the WWTF, which should be considered in the planning and design of retrofits to the existing pond.

7.2.3 Flow Conveyance to the Water Quality Treatment Facility

Stormwater runoff will be conveyed to the lagoon in the Second Street 30 inch stormwater main. Peak flows in excess of the water quality design flows conveyed to the lagoon will be allowed to bypass and overflow to the river. A high flow bypass is allowed for water quality treatment facilities in accordance with Ecology guidelines. Possible locations of a high flow bypass could include the existing 18-inch Avenue H outfall (CSO #1) or an overflow near the WWTF lagoon location.

Runoff from the First Street trunk will flow via gravity to a pump station at First Street and Avenue E. This flow will be pumped to the Second Street trunk. Peak flows in the First Street trunk that exceed the water quality treatment design flow rate (6-month, 24-hour storm) will be discharged directly to the river via the existing 24-inch outfall at Avenue E.

The major work items for the project would include:

- Extend the 30 inch storm main in Second Street east to Avenue E and west from the WWTF entrance to the old wastewater lagoon.
- Disconnect the Avenue F stormwater pipeline from the CSO pipeline on Second Street and reconnect it to the new 30 inch stormwater main.

- Extend a new 12 inch stormwater pipeline along Avenues E, G, H, I, and L from Fifth Street to the 30 inch stormwater main on Second Street and Avenue J from 7th Street to the 30 inch storm main.
- Install new 12 inch storm pipelines on Fifth Street and Riverview Lane and connect them to the new storm main along Avenue J.
- Disconnect the existing catch basins in the separation area and reconnect them to the new 12 inch stormwater pipelines.
- Install manholes at the connection points of the 12 inch stormwater pipelines to the 30 inch storm main along Second Street.
- Install new catch basins where needed to improve drainage.

7.2.4 Estimated Capital Costs

A preliminary cost estimate was developed for the major work items listed above and as shown on Figure C-13. The cost summary table is located in Appendix B. The estimated project cost, including construction, sales tax, engineering design, permitting, survey, contingency, and construction services, is \$2.7 million.

Eliminating other stormwater sources to the existing sewer system, such as roof drains, could be added to this project in the future. Due to the uncertainty of the amount of roof drains and their locations, this work was not included in the preliminary cost estimate for this CSO separation project. Further evaluation would be recommended to quantify the number and location of roof drains that could be targeted for CSO separation.

8.0 RECOMMENDED PLAN

This section describes the City’s evaluation process, the selected priority of stormwater improvement projects, and how the CIP will be funded over time.

Part of the evaluation process included preparation of a State Environmental Policy Act (SEPA) checklist which describes potential environmental impacts and considerations for the implementation phase. The SEPA checklist is presented in Appendix C.

8.1 STORMWATER UTILITY FUND

In October 2010, FCS Group prepared a Financial and Rate Forecast Update for the Water, Storm, and Wastewater Utilities (FCS Group 2010). Upgrades to the stormwater system identified in this plan will be funded through the stormwater utility and potential project related grants. The rate forecast was not updated for this plan.

The 2010 financial rate forecast for stormwater included the following assumptions:

- Study period: 2011 to 2016;
- Customer growth: 0.6%;
- Construction cost inflation: 4.0%;
- New revenue debt service: 30 years, 5.0% interest rate;
- Operating fund target: 60 days of O&M;
- Capital fund target: \$300,000;
- Capital program of \$3.2 million dollars (2011 dollars);
- New debt service of \$85,000 in 2013, increasing to \$170,000 in 2016.

The 2010 study concluded that stormwater rate increases were required to fund the \$3.2 million in forecasted projects (see Table 8-1). Rate increases of 8.25% were adopted for years 2011 and 2012 and 5.1% for years 2013 to 2016. Over the timeframe of 2011 to 2016, average residential bi-monthly bills were estimated to range from \$20.61 to \$27.22 (see Table 8-2). Table 8-3 shows the distribution of funds for the stormwater utility based on the 2011 stormwater utility capital program.

(Reference: FCS Group 2010)

8.2 PROGRAMMATIC RECOMMENDATIONS

The Stormwater Management Program, including O&M, as described in Section 5 is recommended for continued implementation. Funding for this program is included in the Operating budget of the 2010 financial study (FCS Group 2010).

8.3 RECOMMENDED CAPITAL IMPROVEMENTS

Table 8-4 shows the 14 capital projects evaluated during the development of this plan. Total project costs include design, permitting, investigations, construction cost, sales tax, and 20% contingency. The estimated costs for all 14 projects is approximately \$5.1 million.

The proposed CIP is shown in Table 8-4 and includes a project implementation schedule of approximately seven years. In addition to project implementation, the following steps are recommended:

1. Annually meet with all with City Public Works Operations staff to:
 - a. Identify changes in the risk related to the problems addressed by the current CIP project list.
 - b. Identify ongoing or new stormwater problems that should be considered for addition to the project list.
2. Annually review the data contained in Table 6-1 and Appendix A, and add updated information that is collected regarding each problem and solution.
3. Store information collected during the two prior steps in a paper or electronic file that can be revisited on an annual basis, and used to formally update the CIP and programmatic elements of the plan.
4. Review Sections 5, 6, and 7 when the plan is updated every 6 years or sooner as needed. Use the information collected in prior steps to justify adding, removing, or modifying projects.

Table 8-4 CIP Project Implementation Schedule

City Priority	Project	Location	Total Cost (2012 dollars)	2014	2015	2016	2017	2018	2019	2020 (+)
1	C-12	Blackmans Lake Outfall Control Project	\$528,000	\$100,000	\$428,000					
1	C-13	CSO Separation	\$2,700,000	\$120,000	\$400,000	\$1,100,000	\$1,080,000			
1	C-4	Park Avenue/ Blackmans Lake	\$62,000	\$62,000						
2	C-1	87 th Avenue SE (Sinclair Avenue)	\$78,000		\$78,000					
3	C-5b	Holly Vista Drive	\$394,000					\$80,000*	\$314,000*	
4	C-5a	16 th Street	\$122,000					\$25,000*	\$97,000*	
5	C-3	Maple Avenue (Unopened Fairview Street)	\$60,000					\$60,000		
6	C-6	Cypress Avenue	\$77,000						\$77,000	
7	C-11	Bonneville Avenue	\$10,000		\$10,000					
8	C-10	Short and Long Streets	\$224,000							\$224,000
9	C-9	Baird and Victor Avenues	\$234,000							\$234,000
10	C-8	Grove Street	\$89,000							\$89,000
11	C-2	Swifty Creek (at Second Street)	\$468,000							\$468,000
12	C-7	Third Street and Avenue D	\$14,000	\$14,000						
	Total Annual Expenditures (Inflation: 0% per year)		\$5,060,000	\$296,000	\$916,000	\$1,100,000	\$1,080,000	\$165,000	\$488,000	\$1,015,000

Problem - Swifty Creek drains through a 24" storm drain pipeline beginning just north of 2nd Street between Union and Cedar Avenues, and terminating at the Snohomish River. A large section of this pipeline crosses private property. Due to poor pipe condition and/or partial pipe blockage, Swifty Creek backs up and causes deep backwater in the open creek sections.

APPENDIX A

IMPROVEMENT/PROJECT SUMMARY SHEETS

Improvement/Project Summary

Project:	Area C-1: 87 th Avenue S.E. (Sinclair Ave.)	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Intersection of 50 th Street & 87 th Ave. SE (Sinclair)	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
Localized flooding occurs at the northeast corner of the intersection during large storm events. Flood waters approach private property.		
City Actions and/or Analysis Process and Results:		
The City of Snohomish maintenance staff answers complaints from local residences about stormwater backing up and ponding and routinely makes field observations. Drainage systems to and from the problem area were field verified to determine the preferred option for reducing or eliminating the ponding problem.		
Recommended Improvement:		
Construct a new storm drain pipeline along 87 th Avenue SE from the ponded area near 50 th Street to the receiving drainage system near Bickford Avenue.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$78,000	
Challenges, Impacts or Enhancements		
(Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No apparent impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	5	Fish/Wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of 87 th Ave. SE.
O&M:	5	New pipeline to require periodic maintenance.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits required.
Overall Score	20	

Improvement/Project Summary

Project:	C-2: Swifty Creek	
Stakeholders:	Local Community and City of Snohomish	
Location/Address:	First St. to Second St. Along Glen and Union Ave.	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
Due to damage and/or blockage in the existing storm drainage pipeline from the open channel of Swifty Creek to the final outlet system at Snohomish River, stormwater backs up in the open channel section of Swifty Creek. Water in Swifty Creek becomes deep and stagnate. Safety and flooding is of concern for adjacent properties.		
City Actions and/or Analysis Process and Results:		
Deep, stagnate water is observed in the creek after rain events and during the dry season. City personnel attribute this to localized groundwater flowing into the creek and blockage in the existing pipeline. The existing pipe extends under several private properties which makes cleaning, repairing, or replacing damaged pipe unfeasible.		
Recommended Improvement:		
Construct a new pipeline that would be placed within City owned right-of-way along Glen and Union Avenues, from Second St. to First St. A small section of pipeline, at the upstream end of the proposed new pipeline, will require an easement.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$468,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	5	Potential impacts to wetlands within creek.
Easement Acquisition:	10	Easement acquisition is required.
Fish/Wildlife Habitat Including Water Quality:	7	Swifty Creek is a non-fish bearing creek but a HPA may be required.
Construction:	8	Construction within downtown roadways requiring closures and detours.
O&M:	7	Pipeline and manhole maintenance necessary.
Public Acceptance (based on cost, safety and property damage):	7	Community acceptance may be difficult due to project cost.
Permitting:	7	Construction and environmental permits required.
Overall Score	51	

Improvement/Project Summary

Project:	C-3: Maple Avenue	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Maple Ave. & Fairview St. (unopened section)	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
A ditch receiving stormwater runoff from Suncrest Dr. overflows during large storm events. The ditch enters a private culvert and open pond drainage system that is too small to accommodate the stormwater flow. Water that overflows the ditch flows down the unopened gravel section of Fairview Dr. to Maple Ave. and causes erosion in the gravel drive way. Eroded gravel/sand materials are deposited on the sidewalk and on Maple Ave.		
City Actions and/or Analysis Process and Results:		
City maintenance staff has periodically repaired the gravel surfacing on the unopened Fairview Drive and cleaned debris from the sidewalk and street (Maple Ave.).		
Recommended Improvement:		
Construct new 12-inch storm drain pipeline from ditch to existing Maple Ave storm main.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$60,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Maple Dr. partially closed during construction.
O&M:	5	New pipeline to require periodic maintenance.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits are anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-4: Park Avenue/Blackmans Lake	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Park Ave. & 19 th St.	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
Stormwater flow from the Park Ave. ditch enters a 12" pipeline that empties into a down-gradient manhole that directs flow to an outfall pipe to Blackmans Lake. The 12" pipe is too small to accommodate large storm flows. As a result, stormwater backs up within an adjacent catch basin and surface flows onto private property.		
City Actions and/or Analysis Process and Results:		
The City Public Works Department has received several calls from citizens complaining about the stormwater entering their property caused by back water in the catch basin.		
Recommended Improvement:		
Replace the existing 12" storm drain pipeline with a 24" pipeline that will accommodate the larger storm flows (under existing and long term conditions).		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$62,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be adversely impacted.
Construction:	5	One block of Park Ave. will be partially closed during construction.
O&M:	5	New pipeline to require periodic maintenance.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project due to reduction in property damage.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-5a: 16 th Street	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	16 th St. between Pine Ave. and Terrace Ave.	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
There is no drainage system along this section of 16 th St. Stormwater runoff approaches private properties along 16 th St.		
City Actions and/or Analysis Process and Results:		
The City Public Works Department has received calls from citizens complaining about the stormwater accumulation along 16 th St.		
Recommended Improvement:		
Construct a stormwater collection and conveyance system along 16 th St. The system would consist of catch basins and a storm drain main that would connect to the roadside ditch along Pine Ave.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$122,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	16 th St. will be partially closed during construction.
O&M:	7	Periodic pipeline and catch basin maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits required.
Overall Score	17	

Improvement/Project Summary

Project:	C-5b: Holly Vista Drive	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Holly Vista Dr.	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
There is no drainage system along Holly Vista Dr. Stormwater runoff sheet flows across the roadway and onto private property.		
City Actions and/or Analysis Process and Results:		
The City Public Works Department has received calls from citizens with complaints about the stormwater flooding their property.		
Recommended Improvement:		
Construct a stormwater collection and conveyance system along Holly Vista Dr. The system would consist of catch basins and a storm drain main that would connect to an existing storm manhole located on Suncrest Dr. A detention pipe is anticipated to be needed to control flooding downstream.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$394,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Holly Vista Dr. will be partially closed during construction.
O&M:	7	Periodic pipeline, catch basin, and detention pipe maintenance required.
Public Acceptance (based on cost, safety and property damage):	5	Community likely in favor of project.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	19	

Improvement/Project Summary

Project:	C-6: Cypress Avenue	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Cypress Ave. (from 4 th St. north to end)	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
Four catch basins on the north end of Cypress Ave. drain to a private catch basin. The private catch basin plugs periodically and during large storm events the Cypress Ave. catch basin overflows and water flows onto private properties.		
City Actions and/or Analysis Process and Results:		
City maintenance staff periodically cleans the private catch basin to help prevent the upstream city catch basins from backing up onto private property. At times during storm events, the City staff needs to unclog/maintain the private catch basin during storm events.		
Recommended Improvement:		
Disconnect from the existing private catch basin and connect the four city catch basins to the existing storm main that connects to the CSO pipeline along Cypress Ave.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$77,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of Cypress Ave.
O&M:	7	Periodic pipeline and catch basin maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits required.
Overall Score	17	

Improvement/Project Summary

Project:	C-7: Avenue D and Third Street	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Intersection of Avenue D and Third Street	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
The gutter catch basin located at the northeast corner of the intersection does not drain efficiently due to damage to the catch basin outlet pipe. As a result, water ponds at this intersection corner during large storm events. The outlet pipe is damaged because of tree roots from a nearby tree.		
City Actions and/or Analysis Process and Results:		
City maintenance staff periodically cleans the outfall pipe and tries to cut the roots from the inside of the pipe.		
Recommended Improvement:		
Replace the existing outfall pipe with a new one and install the new pipe inside a steel casing pipe. The casing pipe will prevent tree roots from accessing the carrier pipe.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$14,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of Avenue D and 3 rd Street.
O&M:	5	Periodic pipe maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-8: Grove Street	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Grove Street Between Lincoln Avenue and Pine Avenue	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
There is not a stormwater collection system along Grove Street. Stormwater sheet flows and ponds in areas along the street and the right-of-way.		
City Actions and/or Analysis Process and Results:		
City maintenance staff periodically answers complaints from local residences about stormwater ponding along the street and in their driveway.		
Recommended Improvement:		
Install a new stormwater collection system consisting of catch basins and a 15" storm pipeline that would tie into the existing storm main located on Lincoln Avenue.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$89,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of Grove Street.
O&M:	5	Periodic pipe maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-9: Baird and Victor Avenues	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Baird and Victor Avenues between 7 th and 8 th Streets	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
There is not a stormwater collection system along Baird and Victor Avenues. Stormwater sheet flows and ponds in areas along the street and the right-of-way.		
City Actions and/or Analysis Process and Results:		
City maintenance staff periodically respond to complaints from local residences about stormwater ponding along the street and in their driveways.		
Recommended Improvement:		
Install a new stormwater collection system consisting of catch basins and a 12" to 15" storm pipeline that would tie into the existing storm main located on 7 th Street.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$234,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of Grove Street.
O&M:	5	Periodic pipe maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-10: Short and Long Streets	
Stakeholders:	Local Property Owners & City of Snohomish	
Location/Address:	Short and Long Streets at Mill Avenue	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
There is not a stormwater collection system along Short and Long Streets. Stormwater sheet flows and ponds in areas along the street and the right-of-way. Also, Short Street is not paved and small to medium size potholes form frequently.		
City Actions and/or Analysis Process and Results:		
City maintenance staff periodically answers complaints from local residences about stormwater ponding along the street and in their driveways. Also, City staff periodically needs to maintain Short Street to fill in the potholes.		
Recommended Improvement:		
Install a new stormwater collection system consisting of catch basins and a 12" storm pipeline that would tie into the existing storm main located on Mill Avenue.		
Cost Estimate (see Appendix B for cost breakdown)		
Total (design, permitting, construction, tax, contingency):	\$224,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No impact to wetlands.
Easement Acquisition:	0	Easements are not required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/wildlife habitat will not be impacted.
Construction:	5	Construction requires partial closure of Grove Street.
O&M:	5	Periodic pipe maintenance required.
Public Acceptance (based on cost, safety and property damage):	3	Community likely in favor of project.
Permitting:	2	Only construction permits anticipated to be required.
Overall Score	15	

Improvement/Project Summary

Project:	C-11: Bonneville Avenue	
Stakeholders:	Local Community and City of Snohomish	
Location/Address:	Bonneville Avenue near Bickford Avenue	
Date:	August 2013	
Problem Description:	Photo/Map/Sketch:	
Water is ponding in the driveways to a residential house and commercial business.		
City Actions and/or Analysis Process and Results:		
City maintenance staff receives complaints of localized flooding/ponding water from the land owners.		
Recommended Improvement:		
Install a new catch basin at each driveway to drain the water from the driveways to the existing storm main located across the street.		
Total (design, permitting, construction, tax, contingency):		
Total (design, permitting, construction, tax, contingency):	\$10,000	
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)		
Wetlands:	0	No potential impacts to wetlands.
Easement Acquisition:	0	No easement acquisition is required.
Fish/Wildlife Habitat including Water Quality:	0	Fish/Wildlife habitat will not be impacted.
Construction:	5	Construction will require partial road closure.
O&M:	5	Pipeline and catch basins to require periodic maintenance.
Public Acceptance:	3	Community likely in favor of project.
Permitting:	5	Only construction permits anticipated to be required.
Overall Score	18	

Improvement/Project Summary

Project:	C-12: Blackmans Lake Outlet
Stakeholders:	Local Community and City of Snohomish
Location/Address:	
Date:	August 2013
Problem Description:	Photo/Map/Sketch:
Lake floods during large storm events due to constrictions at Blackmans Lake outlet and along Swifty Creek. Rising waters have caused flooding problems for properties along the lake.	See Figure C-12
City Actions and/or Analysis Process and Results:	
City is currently addressing this problem under a separate project.	
Recommended Improvement:	
See Figure C-12.	
Cost Estimate (City provided cost)	
Total:	\$528,000
Challenges, Impacts or Enhancements	
(Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)

Improvement/Project Summary

Project:	C-13: CSO Separation
Stakeholders:	Local Community and City of Snohomish
Location/Address:	Downtown Area Between Avenues F and L and First and Fifth Streets
Date:	August 2013
Problem Description:	Photo/Map/Sketch:
Existing stormwater system in this area discharges into the sanitary sewer system and impacts the sewer treatment process and creates overflows to the Snohomish River during large storm events.	See Figure C-13
City Actions and/or Analysis Process and Results:	
Separating sewer from stormwater would benefit water quality within the Snohomish River and reduce the amount of water requiring treatment. A stormwater quality pond located within the former (closed) wastewater lagoon would provide treatment of stormwater prior to discharge to the river.	
Recommended Improvement:	
See Section 7 and Figure C-13	
Cost Estimate (see Appendix B for cost breakdown)	
Total (design, permitting, construction, tax, contingency):	\$2,700,000
Challenges, Impacts or Enhancements (Rate from 1 to 10, high scores indicate challenges/impacts on project completion. Total < 35 preferred.)

APPENDIX C
SEPA CHECKLIST

CITY OF SNOHOMISH

Founded 1859, Incorporated 1890

116 UNION AVENUE • SNOHOMISH, WASHINGTON 98290 • TEL (360) 568-3115 FAX (360) 568-1375

STATE ENVIRONMENTAL POLICY ACT (SEPA) CHECKLIST

PURPOSE OF CHECKLIST

The State Environmental Policy Act (SEPA), Chapter 43.21C RCW, requires all governmental agencies to consider the environmental impacts of a proposal before making decisions. An environmental impact statement (EIS) must be prepared for all proposals with probable significant adverse impacts on the quality of the environment. The purpose of this checklist is to provide information to help you and the agency identify impacts from your proposal (and to reduce or avoid impacts from the proposal, if it can be done) and to help the agency decide whether an EIS is required.

INSTRUCTIONS FOR APPLICANTS

This environmental checklist asks you to describe some basic information about your proposal. Governmental agencies use this checklist to determine whether the environmental impacts of your proposal are significant, requiring preparation of an EIS. Answer the questions briefly, with the most precise information known, or give the best description you can.

You must answer each question accurately and carefully, to the best of your knowledge. In most cases, you should be able to answer the questions from your own observations and project plans without the need to hire experts. If you really do not know the answer, or if a question does not apply to your proposal, write “do not know” or “does not apply.” Complete answers to the questions now may avoid unnecessary delays later.

Some questions ask about governmental regulations, such as zoning, shoreline, and landmark designations. Answer these questions if you can. If you have problems, the governmental agencies can assist you.

The checklist questions apply to all parts of your proposal, even if you plan to do them over a period of time or on different parcels of land. Attach any additional information that will help describe your proposal or its environmental effects. The agency to which you submit this checklist may ask you to explain your answers or provide additional information reasonably related to determining if there may be significant adverse impact.

USE OF CHECKLIST FOR NONPROJECT PROPOSALS

Complete this checklist for nonproject proposals, even though questions may be answered “does not apply.” IN ADDITION, complete the SUPPLEMENTAL SHEET FOR NONPROJECT ACTIONS (part D).

For nonproject actions, the references in the checklist to the words “project,” “applicant,” and “property or site” should be read as “proposal,” “proposer,” and “affected geographic area,” respectively.

last revision: 073009

CITY OF SNOHOMISH
ENVIRONMENTAL CHECKLIST

FILE NO.

DATE RECEIVED:

I. BACKGROUND

ADMINISTRATION
COMMENTS ONLY

A. Name of proposed project, if applicable:

City of Snohomish Stormwater Comprehensive Plan Update

B. Name, address and telephone number of property owner(s):

*Max Selin, Project Engineer
City of Snohomish
116 Union Avenue
Snohomish, WA 98290
360-282-3196*

C. Name, address and telephone number of representative(s) [contractor, architect, etc.]:

*Carla Talich, Senior Civil Engineer
URS Corporation
1501 4th Avenue, Suite 1400
Seattle, WA 98101
206-438-2125*

D. Date checklist prepared:

August 2013

E. Agency requesting checklist:

Washington State Department of Ecology

F. Proposed timing or schedule (including phasing, if applicable):

The Stormwater Comprehensive Plan Update (“Plan”) is expected to be finalized in fall 2013. The Plan will be implemented over a several year period (6-10 years), with periodic updates. Activities associated with the Plan are anticipated to occur during this timeframe.

G. Do you have any plans for future additions, expansion, or further activity related to or connected with this proposal? If yes, explain.

This SEPA review for the Plan update is a “non-project action.” There are specific actions described in the Plan for future additions and expansions to provide acceptable levels of service; these will be reviewed under separate project and site-specific SEPA processes.

H. List any environmental information you know about that has been prepared, or will be prepared, directly related to this proposal.

*May 2005 CSO Reduction Plan Update, Tetra Tech/KCM
October 2004 Environmental Report, Tetra Tech/KCM*

I. Do you know whether applications are pending for governmental approvals of other proposals directly affecting the property covered by your proposal? If yes, explain.

No.

J. List any government approvals or permits that will be needed for your proposal, if known.

The Plan is subject to approval by the Washington State Department of Ecology and the City of Snohomish. Individual projects recommended in the plan may require city, state or federal permits on a case-by-case basis.

K. Give a brief, complete description of your proposal, including the proposed uses and the size of the project and site. (There are several questions later in this checklist which ask you to describe certain aspects of your proposal. You do not need to repeat those answers on this page.)

The original study area from the 2001 Plan included the Incorporated City Limits of Snohomish as well as adjoining unincorporated areas of Snohomish County. This Plan update has been prepared to address the following additional areas:

- *The North Planning Area, north of US Highway 2, and contributing areas;*
- *Additional areas to the west of the original study area that contribute flow to the Upper Cemetery Creek and Lower Cemetery Creek basins; and*
- *Additional areas to the east of the original study area that contribute flow to the Pilchuck basin.*

Twelve stormwater projects (C-1 to C-12) and one Combined Sewer Separation project (C-13) are included in the Plan. The Plan has been prepared to meet the rules and regulations of the Washington State Department of Ecology regarding storm drainage facilities. The plan is also written to be consistent with requirements of the State Growth Management Act and the City of Snohomish Comprehensive Plan.

L. Location of the proposal including street address (if any) and legal description (including section, township and range). Give sufficient information for a person to understand the precise location of your proposed project. If a proposal would occur over a range of area, provide the range or boundaries of the site(s). (You are not required to duplicate maps or detailed plans submitted with any permit applications related to this checklist.)

The City of Snohomish is located in Snohomish County. The study area for the Plan is approximately 4,869 acres (see Figure 1), consisting of the following drainage basins:

- *Upper Cemetery Creek basin, located in the northwest corner of the study area (875 acres);*
- *Lower Cemetery Creek basin, located in the westernmost portion of the study area (1,015 acres);*
- *Blackmans Lake basin, located in the north-central portion of the study area (465 acres);*
- *Swift Creek basin, located in the south-central portion of the study area (330 acres);*
- *Pilchuck River basin, located in the westernmost portion of the study area (466 acres);*
- *Bunk Foss basin, located in the northeast corner of the study area (1,025 acres);*
- *Snohomish River basin, located in the southernmost portion of the study area (445 acres);*
- *Combined Sewer Area, located in the southernmost portion of the study area (248 acres);*

The Plan study area is located within Sections 1, 2, 11-14, 23, and 24 of Township 28N, Range 5E; Sections 5-8 and 17-19 of Township 28N, Range 6E; Sections 25, 26, 35, and 36 of Township 29N, Range 5E; and Sections 29-32 of Township 29N, Range 6E.

II. ENVIRONMENTAL ELEMENTS

A. EARTH

1. General description of the site (circle one): flat; rolling hilly; steep slopes; mountainous; other (explain):

The Plan study area includes varied terrain.

2. What is the steepest slope on the site (approximate percent slope)?

Based on the U.S. Department of Agriculture Natural Resources Conservation Service, slopes in the Plan study area range from 0 to 25 percent.

3. What general types of soils are found on the site? (For example: clay; sand; gravel; peat; muck.)

Plan study area soils are primarily Tokul gravelly loam and Tokul silt loam; these soils are moderately deep and well-drained with moderate permeability.

4. Are there surface indications or history of unstable soils in the immediate vicinity? If so, describe.

Soils in the vicinity of specific construction projects would be evaluated during the design of each project.

5. Describe the purpose, type, and approximate quantities of any filling or grading proposed. Indicate source of fill.

Requirements for filling and grading will be evaluated during the design of each project. Filling and grading will comply with applicable City of Snohomish requirements. If necessary, sources of fill would be determined by the contractor hired.

6. Could erosion occur as a result of clearing, construction, or use? If so, generally describe.

Erosion and sediment transport could occur during clearing and earth moving activities associated with projects included in the Plan. Such activities will be the subject of subsequent project-specific SEPA review.

7. About what percent of the site will be covered with impervious surfaces after project construction (for example: asphalt or buildings)?

This will be evaluated as the projects are designed; however an increase in impervious surfaces is not anticipated.

8. Proposed measures to reduce or control erosion, or other impacts to the earth, if any?

Appropriate Best Management Practices (BMPs) will be installed to help prevent and control runoff and erosion of exposed soils during construction. Low impact development techniques may be applied during the design phase of each project to reduce runoff flow rates and filter pollutants. In addition, a temporary erosion and sediment control plan will be prepared for each Plan-specific project consistent with applicable City of Snohomish requirements.

B. AIR

1. What type of emissions to the air would result from the proposal (i.e., dust, automobile, odors, industrial wood smoke) during construction and when the project is completed? If any, generally describe and give approximate quantities, if known.

Short-term emissions from construction and construction equipment would likely occur during construction of specific projects identified in the Plan.

2. Are there any off-site sources of emissions or odor that may affect your proposal? If so, generally describe.

No.

3. Proposed measures to reduce or control emissions or other impacts to air, if any:

Emission and dust control methods will be used as necessary, including but not limited to: use of proper mufflers, use of air emissions control equipment devices, and wetting disturbed areas to control dust.

C. WATER

1. Surface:

a. Is there any surface water body on or in the immediate vicinity of the site (including year-round and seasonal streams, saltwater, lakes, ponds, wetlands)? If yes, describe type and provide names. If appropriate, state what stream or river it flows into.

Surface water bodies in the Plan study area include Cemetery Creek, Blackmans Lake, Swifty Creek, Bunk Foss Creek, the Pilchuck River, and the Snohomish River. These creeks ultimately flow into either the Pilchuck (which discharges to the Snohomish River) or Snohomish Rivers (which discharges into Puget Sound).

b. Will the project require any work over, in or adjacent to (within 200 feet) the described waters? If yes, please describe and attach available plans.

Construction of specific projects identified in the Plan would occur near Swifty Creek, Blackmans Lake, and several small unnamed ditches.

c. Estimate the amount of fill and dredge material that would be placed in or removed from surface of water or wetlands, and indicate the area of the site that would be affected. Indicate the source of fill material.

To be determined during design of specific projects identified in the Plan.

d. Will the proposal require surface water withdrawals or diversions? Give general description, purpose and approximate quantities if known.

To be determined during design of specific projects identified in the Plan.

e. Does the proposal lie within any 100-year flood plain? If so, note location on the site plan.

It appears that Plan projects C-6 and C-13 are within the 100-year floodplain; no other Plan-specific projects are within the 100-year floodplain.

f. Does the proposal involve any discharges of waste material to surface waters? If so, describe the type of waste and anticipated volume of discharge.

None of the work associated with specific projects identified in the Plan is anticipated to discharge waste materials to surface waters.

2. Ground:

a. Will ground water be withdrawn, or will water be discharged to ground water? Give general description, purpose and approximate quantities, if known.

No.

b. Describe waste material that will be discharged into the ground from septic tanks or other sources, if any (for example: domestic sewage; industrial, containing the following chemicals...; agricultural; etc.). Describe the general size of the system, the number of such systems, the number of houses to be served (if applicable), or the number of animals or humans the system(s) are expected to serve.

Most of the downtown Snohomish area (about 248 acres) is within a Combined Sewer Area. Runoff from this area discharges to the sanitary sewer system. Since stormwater runoff from this area is collected in the sanitary sewer system, these flows are managed by that system. Partial separation of stormwater from the wastewater in this area is contained in the Plan.

3. Water Runoff (including storm water):

a. Describe the source of runoff (including storm water) and method of collection and disposal, if any (including quantities, if known). Where will this water flow? Will this water flow into other waters? If so, describe.

During construction of Plan-specific projects, stormwater runoff from any disturbed areas would be routed through erosion and sediment control facilities to minimize impacts to surface water bodies, including Swifty Creek, Blackmans Lake, and unnamed ditches near proposed project sites. Implementation of projects identified in the Plan would help improve conveyance of stormwater runoff.

b. Could waste materials enter ground or surface waters? If so, generally describe.

To be determined during design of specific projects identified in the Plan; however it is unlikely that waste materials would enter ground or surface waters.

4. Proposed measures to reduce or control surface, ground, and runoff water impacts, if any.

The projects identified in the Plan are designed to improve conveyance of stormwater runoff, reducing flooding, downstream erosion, sedimentation, and impacts to private property.

Appropriate BMPs will be installed to help prevent and control runoff during construction. In addition, a temporary erosion and sediment control plan will be prepared for each Plan-specific project consistent with applicable City of Snohomish requirements.

D. PLANTS

a. Underline types of vegetation found on the site:

deciduous tree:

alder, maple, aspen,
other:

wet soil plants:

cattail, buttercup,
bulrush, skunk cabbage,
other:

evergreen tree:

fir, cedar, pine,
other: madrona

water plants:

water lily, eelgrass, milfoil,
other:

shrubs

pasture

grass

crop or grain

other types of vegetation:

No detailed survey of the Plan-specific project areas has been done. However, there is a wide range of vegetation in the Plan study area, including most listed above.

2. What kind and amount of vegetation will be removed or altered?

Vegetation removal and alteration associated with Plan-specific projects would be limited in scope as the majority of the project work would occur in the roadway or previously disturbed areas.

3. List threatened or endangered species known to be on or near the site.

None known. A query of the Washington Natural Heritage Program database confirmed that no special status plant species are known in the Plan area.

4. Proposed landscaping, use of native plants, or other measures to preserve or enhance vegetation on the site, if any:

To be determined during design of specific projects identified in the Plan. Any required landscaping would conform to City of Snohomish requirements.

E. ANIMALS/WILDLIFE

1. Underline any birds and animals that have been observed on or near the site or are known to be on or near the site:

birds:

heron, eagle, songbirds,
other: crow, seagull, starling, robin, waterfowl, bats, pileated woodpecker

mammals:

deer, bear, elk, beavers,
other: raccoon, squirrel, opossum, coyote, rodent, cottontail rabbit

fish:

bass, salmon, trout, herring, shellfish,
other: steelhead

2. List any threatened or endangered species known to be on or near the site.

Threatened or endangered species known within the Plan study area include: Chinook salmon, bull trout/Dolly Varden, and steelhead. This would be evaluated in further detail for each Plan-specific project.

3. Is the site part of a migrational route? If so, explain.

Yes, the Plan study area is part of the Pacific Flyway.

4. Proposed measures to preserve or enhance wildlife, if any:

Wildlife mitigation measures will be developed during design of specific projects identified in the Plan.

F. ENERGY AND NATURAL RESOURCES

1. What kinds of energy (electric, natural gas, oil, wood stove, solar) will be used to meet the completed projects energy needs? Describe whether it will be used for heating, manufacturing, etc.

Electricity would be used for pumps. Gasoline and diesel fuel would be used for construction equipment.

2. Would your project affect the potential use of solar energy by adjacent properties? If so, generally describe.

No.

3. What kinds of energy conservation features are included in the plans of this proposal? List other proposed measures to reduce or control energy impacts, if any:

Energy efficient pumps and equipment will be used when feasible.

G. ENVIRONMENTAL HEALTH

1. Are there any environmental health hazards, including exposure to toxic chemicals, risk of fire and explosion, spill, or hazardous waste, that could occur as a result of this proposal? If so, describe.

There are no anticipated environment health hazards associated with the Plan or Plan-specific actions – work would occur in previously disturbed areas.

- a. Describe special emergency services that might be required.

None are anticipated.

- b. Proposed measures to reduce or control environmental health hazards, if any:

None proposed.

2. Noise

- a. What types of noise exist in the area which may affect your project (for example: traffic, equipment, operation, other)?

None.

- b. What types and levels of noise would be created by or associated with the project on a short-term or a long-term basis (for example: traffic, construction, operation, other)? Indicate what hours noise would come from the site.

Short-term noise during construction from construction-related activities. Noise is not anticipated during operations of Plan-specific projects.

- c. Proposed measures to reduce or control noise impacts, if any:

Noise associated with construction activities will meet federal, state, and local noise regulations.

H. LAND AND SHORELINE USE

1. What is the current use of the site and adjacent properties?

The designated land uses in the Plan study area are commercial, residential, open disturbed spaces, industrial, and the north planning area. Most of the Plan-specific projects are within residential areas.

2. Has the site been used for agriculture? If so, describe.

Portions of the Plan study area are or have been in use for agriculture; none of the Plan-specific projects occur on agricultural lands.

3. Describe any structures on the site.

The Plan study area contains many residential, commercial, industrial, and recreational structures.

4. Will any structures be demolished? If so, what?

No structures would be demolished.

5. What is the current zoning classification of the site?

The majority of the Plan study area is zoned as Single Family Residential. Plan-specific projects would take place on land zoned as Single Family Residential, Business Park, Pilchuck District, Mixed Use, Historic Business, and High Density Residential.

6. What is the current Comprehensive Plan designation of the site?

The majority of the Plan study area is designated as Single Family Residential. Plan-specific projects would take place on land designated as Single Family Residential, Business Park, Mixed Use Commercial, Commercial, Historic Business Commercial, and Industry.

7. If applicable, what is the current Shoreline Master Program designation of the site?

The City's current Shoreline Master Program has designations of Urban, Suburban, and Rural in the Plan study area. None of the Plan-specific projects are located within the shoreline jurisdiction.

The City is currently updating their Shoreline Master Program; draft designations in the Plan study area include Aquatic, Rural Conservancy, Shoreline Residential, Urban Conservancy, and Downtown Riverfront. It appears that two Plan-specific projects (projects C-4 and C-12) may be located within the draft Shoreline Residential environment around Blackmans Lake; this will be evaluated during design of this specific project.

8. Has any part of the site been classified as an "environmentally sensitive" area? If so, specify.

The Plan study area contains lands mapped as flood hazard areas, earthquake hazard areas, steep slopes, wetlands, and fish and wildlife habitat areas. It appears that two Plan-specific projects (projects C-4 and C-12) may be located within a Class 2 wetland buffer associated with Blackmans Lake – this will be verified during design.

9. Approximately how many people would reside or work in the completed project?

Per the U.S. Census, the Plan study area had a population of approximately 9,100 people in 2010. The population of the City of Snohomish is anticipated to increase to approximately 14,600 people by 2040 (Source: PSRC 2012).

10. Approximately how many people would the completed project displace?

None.

11. Proposed measures to avoid or reduce displacement impacts, if any:

Not applicable.

12. Proposed measures to ensure the proposal is compatible with existing and projected land uses and plans, if any:

The Plan is required to comply with the City's adopted Comprehensive Plan.

I. HOUSING

1. Approximately how many units would be provided, if any? Indicate whether high-, middle- or low-income housing.

None.

2. Approximately how many units, if any would be eliminated? Indicate whether high-, middle- of low-income housing.

None.

3. Proposed measures to reduce or control housing impacts, if any:

Not Applicable.

J. AESTHETICS

1. What is the tallest height of any proposed structure(s), not including antennas; what is the principal exterior building material(s) proposed?

Not applicable.

2. What views in the immediate vicinity would be altered or obstructed?

None.

3. Proposed measures to reduce or control aesthetic impacts, if any:

Landscaping, if necessary, in accordance with City of Snohomish requirements would be included for Plan-specific projects.

K. LIGHT AND GLARE

1. What type of light or glare will the proposal produce? What time of day would it mainly occur?

None.

2. Could light or glare from the finished project be a safety hazard or interfere with views?

No.

3. What existing off-site sources of light or glare may affect your proposal?

None.

4. Proposed measure(s) to reduce or control light and glare impacts, if any:

Not applicable.

L. RECREATION

1. What designated and informal recreational opportunities are in the immediate vicinity?

The Plan study area contains several parks, open space areas, and a County trail (the Centennial Trail).

2. Would the proposed project displace any existing recreational uses? If so, describe.

No.

3. Proposed measures to reduce or control impacts on recreation, including recreational opportunities to be provided by the project or application, if any:

Not applicable.

M. HISTORIC AND CULTURAL PRESERVATION

1. Are there any places or objects listed on, or proposed for, national, state or local preservation registers known to be on or next to the site? If so, generally describe.

None known.

2. Generally describe any landmarks or evidence of historic, archaeological, scientific, or cultural importance known to be on or next to the site:

Three Plan-specific projects, C-2, C-7, and C-13, are located within the Historic District.

3. Proposed measure to reduce or control impacts, if any:

Mitigation of impacts, if any, on historic and cultural sites will be considered during the design of Plan-specific projects C-2, C-7, and C-13.

N. TRANSPORTATION

1. Identify public streets and highways serving the site, and describe proposed access to the existing street system. Show on site plans, if any.

The Plan study area includes multiple arterials and surface streets. Plan-specific projects are located near the following streets: First Street, Second Street, Third Street, 16th Street, 19th Street, 50th Street SE, 87th Avenue SE, Avenue D, Cypress Avenue, Maple Avenue, Holly Vista Drive, and Park Avenue.

2. Is the site currently served by public transportation? If not, what is the approximate distance to the nearest transit stop?

The Plan study area is served by Community Transit routes 270, 275, 277, and 424.

3. How many parking spaces would the completed project have? How many would the project eliminate?

Not applicable.

4. Will the proposal require any new roads or streets, or improvements to existing roads or streets, not including driveways? If so, generally describe (indicate whether private or public).

Upgrades/modifications to existing storm drainage facilities would occur along road rights-of-way. Some Plan-specific projects are located along unimproved rights-of-way; however these rights-of-way would not be improved by project activities.

5. Will the project use (or occur in the immediate vicinity of) water, rail, or air transportation? If so, generally describe.

No.

6. How many vehicular trips per day would be generated by the completed project? If known, indicate when peak volumes would occur.

Infrequent, short visits to storm drainage facilities for inspection and maintenance may be necessary.

7. Proposed measures to reduce or control transportation impacts, if any:

None.

O. PUBLIC SERVICES

1. Would the project result in an increased need for public services (for example: fire protection, police protection, health care, schools, other)? If so, generally describe.

No.

2. Proposed measures to reduce or control impacts on public services, if any:

Not applicable.

P. UTILITIES

1. Underline utilities currently available at the site: electricity, natural gas, water, refuse service, telephone, sanitary sewer, septic system, other (describe):

The above utilities are available in the Plan study area.

2. Describe the utilities that are proposed for the project, the utility providing the service, and the general construction activities on the site or in the immediate vicinity that might be needed.

The Plan proposes improvements to the city stormwater system to serve future needs of the City.

III. SIGNATURE

I hereby certify under penalty of perjury of the Laws of the State of Washington that the above answers are true and complete to the best of my knowledge. I understand that the lead agency is relying on them to make its decision.

**CITY OF SNOHOMISH
ENVIRONMENTAL CHECKLIST
NON-PROJECT ACTIONS**

FILE NO.:

DATE RECEIVED:

Because these questions are very general, it may be helpful to read them in conjunction with the list of the elements of the environment. When answering these questions, be aware of the extent the proposal, or the types of activities likely to result from the proposal, would affect the item at a greater intensity or at a faster rate than if the proposal were not implemented. Respond briefly and in general terms.

IV. SUPPLEMENTAL QUESTIONS FOR NON-PROJECT ACTIONS

**ADMINISTRATION
COMMENTS ONLY**

A. How would the proposal be likely to increase discharge to water; emissions to air; production, storage, or release of toxic or hazardous substances; or production of noise?

The Plan foresees implementation of the 12 Plan-specific stormwater conveyance projects (C-1 through C-12) and one combined sewer separation project (C-13). While there may be increases in noise and emissions to air associated with construction activities to implement Plan-specific projects, there should be no long-term increases.

Proposed measures to avoid or reduce such increases are:

Proper construction practices will avoid or reduce temporary impacts.

B. How would the proposal be likely to affect plants, animals, fish, or marine life?

Construction associated with Plan-specific projects would likely temporarily affect vegetation in non-roadway areas and ditches; areas disturbed for construction may be more susceptible to erosion and stormwater runoff. These impacts would be temporary. Long-term impacts are not anticipated. Impacts to animals, fish, or marine life are not anticipated.

Proposed measures to protect or conserve plants, animals, fish, or marine life are:

The use of Best Management Practices will be required during construction. A Temporary Erosion and Sediment Control Plan for each Plan-specific project developed in compliance with City of Snohomish regulations will also minimize impacts.

C. How would the proposal be likely to deplete energy or natural resources?

Implementation of the Plan and Plan-specific projects are not anticipated to increase the use of energy or natural resources.

Proposed measures to protect or conserve energy and natural resources are:

Not applicable.

D. How would the proposal be likely to use or affect environmentally sensitive areas or areas designated (or eligible or under study) for governmental protection (such as parks, wilderness, wild and scenic rivers, threatened or endangered species habitat, historic or cultural sites, wetlands, floodplains, or prime farmlands)?

It appears that one Plan-specific project (project C-4) may be located within a Class 2 wetland buffer associated with Blackmans Lake – this will be verified during design of this project. For Plan project C-4, an approximately 180-foot existing 12-inch storm drain pipeline would be replaced with a 24-in pipeline. In addition, the existing catch basin and manhole may be replaced if determined to be undersized or in substandard condition.

Proposed measures to protect such resources or to avoid or reduce impacts are:

All local and state regulations concerning sensitive or protected areas, including wetlands, will be followed during implementation of Plan project C-4.

E. How would the proposal be likely to affect land and shoreline use, including whether it would allow or encourage land or shoreline uses incompatible with existing plans?

Improvements included in the Plan should not change or alter land uses in the Plan study area.

Proposed measures to avoid or reduce shoreline and land use impacts are:

Not applicable.

F. How would the proposal be likely to increase demands on transportation or public services and utilities?

The Plan and Plan-specific projects are aimed at improving the conveyance of stormwater; this in itself will not increase the demand for public services. Increases in demands on transportation or public services and utilities will be addressed through zoning and the City's Comprehensive Plan.

Proposed measures to reduce or respond to such demand(s) are:

In the future, additional stormwater facilities, transmission and distribution system improvements could occur to address future demands for such facilities.

G. Identify, if possible, whether the proposal may conflict with local, state, or federal laws or requirements for the protection of the environment:

The Plan is being prepared to meet the rules and regulations of the Washington State Department of Ecology regarding storm drainage facilities. In addition, the Plan will be approved by the City of Snohomish. Plan-specific projects will be evaluated for effects on the environment and, if needed, additional SEPA compliance will be conducted.

DESCRIPTION & PURPOSE

Determine the land use and area that contributes to locations identified by the city that need to be upgraded from a ditch to a pipe. Find the peak flows in these areas and size a pipe to convey the 25year peak flow.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

Project Statement:

There are currently ditches that connect stormwater conveyance pipes within the storm system in the City of Snohomish. On the west side of Sinclair Avenue, the City plans to replace the ditch and install stormwater conveyance pipe in the right of way to convey the 25-year storm event per the Engineering Design and Construction Standards (City of Snohomish, 2004). See attached calculations for a map with location identified.

Land Use and Contributing Area:

The future land use and contributing areas were calculated using 2011 City Land Use Map (City of Snohomish, 2010) and 2007 LiDAR data in ARCGIS. The commercial land use designation was assumed to be 50% impervious. The business park land use designation was assumed to be 90% impervious. The land use designations were verified by interpretation of the aerial photography. The pervious and impervious area for each designated land use is presented in Table 1. The pervious portions were assumed to be in good condition with grass cover on more than 75% of the area, resulting in a curve number of 86. The right-of-way area was assumed to be paved, with a curve number of 98.

Table 1: Impervious and Pervious Areas

Land Use Designation	Total Area (ac)	Impervious Area (ac)	Pervious Area (ac)
Commercial Area (COM)	2.47	1.23	1.24
Business Park (BP)	8.47	7.62	0.85
ROW	0.77	0.77	0.00
Total	11.71	9.62	2.09

The contributing areas to the Sinclair Ave. pipe are outlined in the attached maps. The drainage area contributing to the proposed pipe along Sinclair Ave. is subject to additional field reconnaissance and survey during design to adequately delineate the drainage basin. The northern portion of the delineated drainage area appears to be flowing north to the low area along Sinclair Ave. and Stevens Pass Hwy. The drainage infrastructure in that area is undefined, therefore one conservatively large drainage area was considered. Option A, the delineated drainage area assumes all water flows south along Sinclair Ave. Option B assumed that the north portion of the delineated drainage area is conveyed north to the low area at Sinclair Ave. and Stevens Pass Hwy and only a small portion of the drainage area flows south along Sinclair Ave. This option resulted in a much smaller drainage area (approximately 3.2 acres) and was not evaluated further

The land use area was calculated in ARCGIS. They were separated into pervious and impervious areas for input into the Santa Barbara Urban Hydrograph (SBUH) spreadsheet, a Type 1A unit hydrograph method. The precipitation for the 25-year storm event was determined by using NOAA Atlas 2 isopluvial maps. See attached calculations.

Pipe Sizing:

The City's Design and Construction Standards (City of Snohomish, 2004) that new conveyance elements are to be sized for 25-year, 24-hour storm and checked for 100-year storm to verify if

flooding occurs. The new stormwater conveyance pipes were sized by computing the peak flow resulting from 24-hour duration, 25-year recurrence interval storm, using the SBUH method.

The size of the storm drain pipe was based on the peak flows calculated using the SBUH method.

Bentley Systems, Inc. FlowMaster, 2008 software was used to size the pipes. The pipe was graded so that it can gravity drain to the connection point. It is anticipated that a minimum of three feet of cover over the pipes; therefore, polyvinyl chloride (PVC) was feasible. A 1% slope was checked using the peak flows from the 25-year storm event. It was determined that for Option A, a 15-inch PVC pipe can be used. Verification of drainage connection points and flow for the northern portion of the drainage area is recommended to be checked during the design phase.

Results:

Based on the calculations described above, it is recommended that a 15-inch diameter PVC pipe be used. Results and calculations for each location are attached.

City of Snohomish
Stormwater Comprehensive Plan
Time of Concentration
Option A-Sinclair Tc

Calculate Time of Concentration (Tc)

$$T_c = \text{Sum}(T_t)$$

Where:

$$T_t = \text{travel time (min)} = \frac{L}{(60 \times V)} \quad (\text{for shallow concentrated flow or channel flow})$$

$$T_t = \text{travel time (min)} = \frac{0.42(n_s L)^{0.8}}{(P_2)^{0.5}(s_o)^{0.4}} \quad (\text{for sheet flow})$$

Where:

$$V = \text{avg. velocity (ft/s)} = V = k(s_o)^{0.5}$$

k = time of concentration velocity factor (ft/s) (see Attachment __)

L = flow length (ft)

n_s = sheet flow Manning's effective roughness coefficient (see Attachment __)

P_2 = 2-year, 24-hour rainfall (in), (see Attachment __)

s_o = slope of hydraulic grade line (land slope, ft/ft)

	L (ft)	$k_{s/c}$	V (fps)	n_s	P_2	s_o (ft/ft)	Tt (min)
a - sheet	100	NA	NA	0.011	1.8	0.01	2.1
b - shallow	255	27	5.2	NA	NA	0.04	0.8
c - culvert	508	42	8.1	NA	NA	0.04	1.0
d - channel	519	17	3.5	NA	NA	0.04	2.5
e - culvert	235	42	13.7	NA	NA	0.11	0.3
Total (Tc)							6.8

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Sinclair Ave - OPTION A
 Storm Event: 25-YEAR, 24-HOUR
 Given:

Area = 11.71 acres
 Pt = 3.05 inches
 dt = 10 min.
 Tc = 6.8 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 2.09 acres Area = 9.62 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
T _{pk} (hrs)	= 7.83
T _c (min)	= 6.8
Q _{pk} (cfs)	= 7.98
Vol(cf)	= 111,004

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2 / (Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.4237
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 111,004 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Sinclair Ave - OPTION A
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 11.71 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 6.8 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 2.09 acres Area = 9.62 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
T _{pk} (hrs)	= 7.83
T _c (min)	= 6.8
Q _{pk} (cfs)	= 9.89
Vol(cf)	= 137,881

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.4237
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 137,881 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

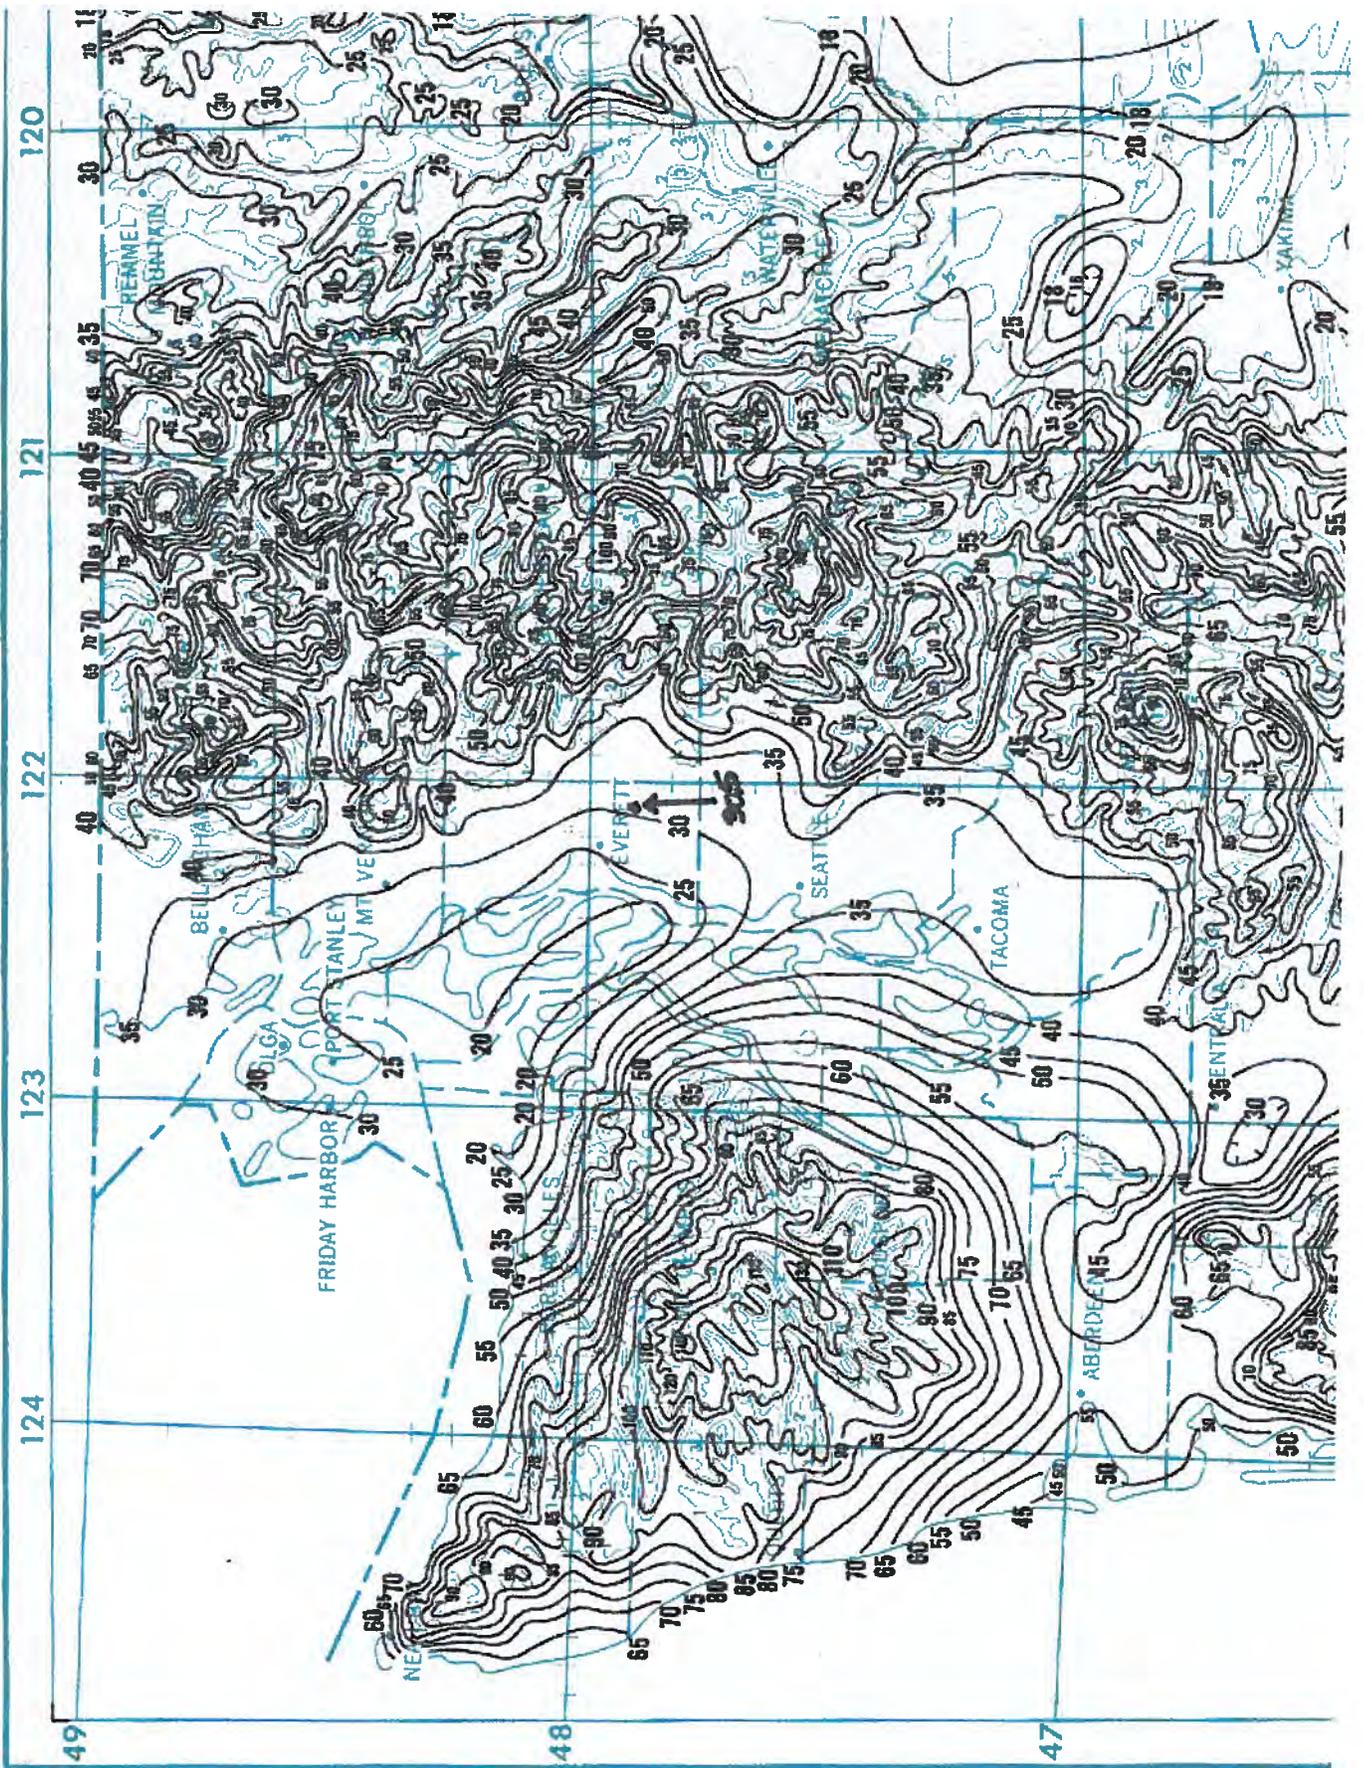

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

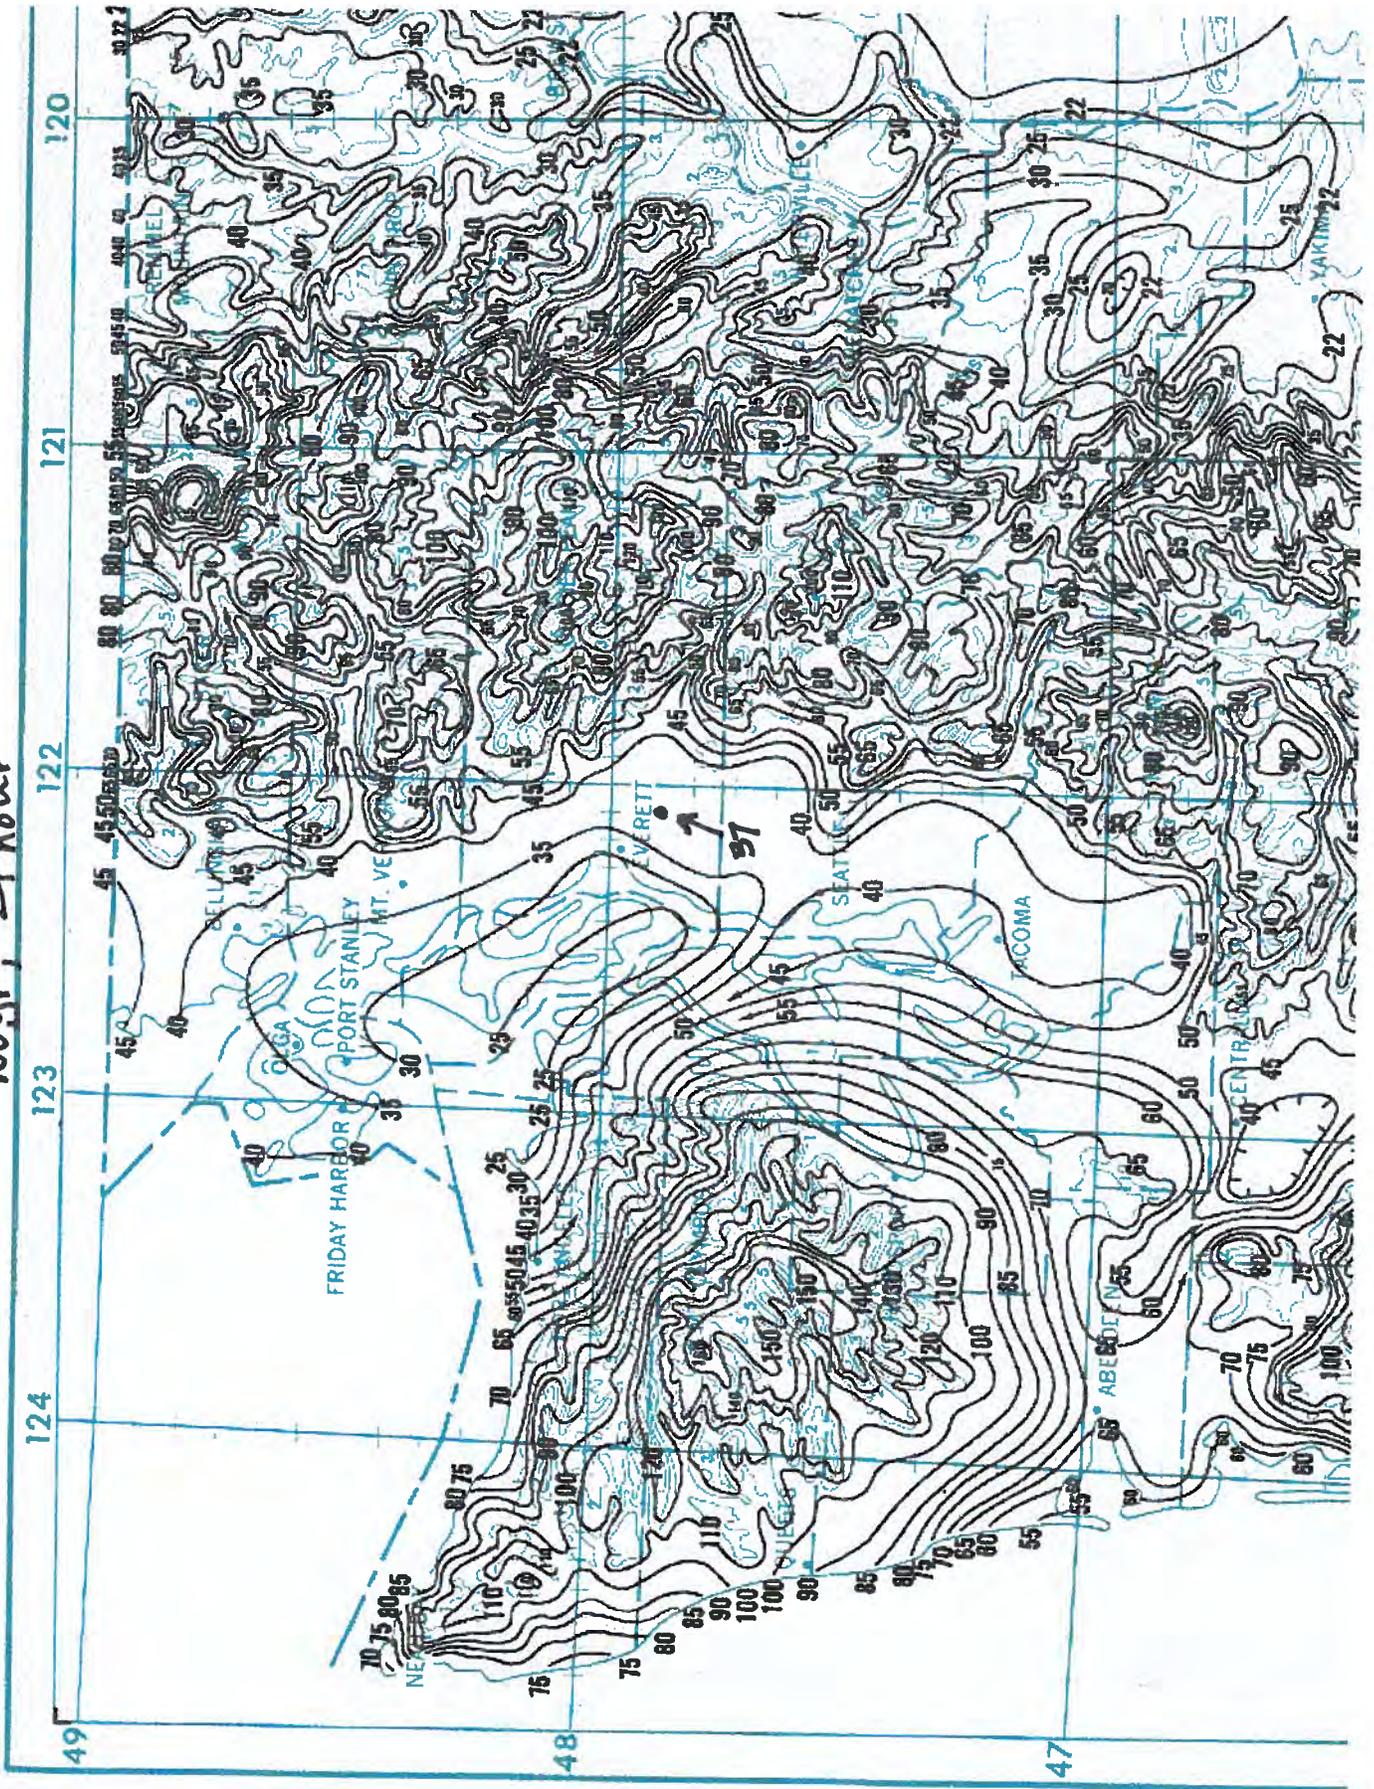

Table 4.4.1 Values of “n” and “k” for use in computing Time of Concentration

FOR SHEET FLOW	n_s
Smooth surfaces (concrete, asphalt, gravel, or bare hard soil)	0.011
Fallow fields of loose soil surface (no vegetal residue)	0.05
Cultivated soil with crop residue (slope < 0.20 ft/ft)	0.06
Cultivated soil with crop residue (slope > 0.20 ft/ft)	0.17
Short prairie grass and lawns	0.15
Dense grass	0.24
Bermuda grass	0.41
Range, natural	0.13

Stormwater Conveyance – Blackmans Lake

Project Name:	Stormwater Comprehensive Plan Update	Project Number:	33763575
Project Location:	City of Snohomish	Client Name:	City of Snohomish
PM Name:	Carla Talich	PIC Name:	Kevin Weed

IDENTIFYING INFORMATION

(This section is to be completed by the Originator.)

Calculation Medium: Electronic File Name: K:\City of Snohomish\Stormwater Comp Plan\Stormwater Modeling - NEW moved\Blackmans Lake

(Select as appropriate)

Hard-copy

Unique Identification:

Number of pages
(including cover sheet): 49

Discipline: Hydraulics
 Title of Calculation: Stormwater Conveyance - Blackmans Lake
 Calculation Originator: Gina Franco
 Calculation Contributors: Tobey Clarkin
 Calculation Checker: Carla Talich

DESCRIPTION & PURPOSE

Determine the land use and area that contributes to locations identified by the city that need to be upgraded from a ditch to a pipe. Find the peak flows in these areas and size a pipe to convey the 25year peak flow.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

ISSUE / REVISION RECORD

Checker comments, if any, provided on: hard-copy electronic file Form 3-5 (MM)

Project Statement:

There are currently stormwater conveyance pipes within the storm system in the City of Snohomish (City) that have been identified as areas that flood. One particular pipe that overflows is upstream of the inlet into Blackmans Lake. The City plans to upsize the pipe to be able to convey a minimum 25-year storm event per the Design and Construction Standards (City of Snohomish, 2004). See attached calculations for a map with location identified.

Land Use and Contributing Area:

The future land use and contributing areas were calculated using 2011 City Land Use Map (City of Snohomish, 2010) and 2007 LiDAR data in ARCGIS. To be conservative, the single family residential land use was assumed to be multifamily (50% pervious and 50% impervious) (Taylor, 1993). The area is mostly developed and may fall under high density residential land use. Further refinement of land use may be conducted during the design phase.

The contributing areas to Blackmans Lake inlet pipe is the flow from the detention pond upstream of Blackmans Lake inlet and the area to the east and south of the Blackmans Lake inlet. Therefore the areas were added together to determine the total contributing areas to the Blackmans Lake.

The existing land uses within the contributing areas were verified by interpretation of the aerial photograph. The existing single family residential land use in the contributing area to the detention pond was assumed to be 20 percent of the zoned single family land use. The other 80 percent was assumed currently to be forest. The existing single family residential land use in the contributing area to the east and south of the Blackmans Lake inlet was assumed to be 80 percent of the zoned single family land use. The other 20 percent was assumed currently to be park. The right of way future land use in both contributing areas was verified to be the same area for existing.

The pervious portions were assumed to be in good condition with grass cover on more than 75 percent of the area, resulting in a curve number of 86. The right-of-way area was assumed to be paved, with a curve number of 98. The existing land use and contribution areas were scaled from the aerial map with the future land use areas delineated.

The land use areas calculated in ARCGIS were separated into pervious and impervious areas for input into the Santa Barbara Urban Hydrograph (SBUH) spreadsheet, a Type 1A unit hydrograph method. The precipitation for the 25- and 100-year storm events was determined by using NOAA Atlas 2 isopluvial maps. See attached calculations.

Pipe Sizing:

The new stormwater conveyance pipes were sized by computing the peak flow resulting from 24-hour duration, 25- and 100-year recurrence interval storms, using the SBUH method. The Design and Construction Standards (City of Snohomish, 2004) states that new conveyance elements are to be sized for 25-year, 24-hour storm and checked for 100-year storm to verify possible flooding.

The size of the pipes was based on the peak flows calculated using the SBUH method.

Bentley Systems, Inc. FlowMaster, 2008 software was used to size the pipes. The pipes were graded so that they can gravity drain to the connection point. Slopes ranging from 5 percent to 6.8 percent were checked using the peak flows from the 25- and the 100-year storm events. The slopes used were based on the existing topography and the existing pipes that were analyzed. The pipe sizing conclusions can be seen in Table 1.

**Table 1: Flow and Pipe Size Summary
from Detention Pond**

Flow from Detention Pond					
	Existing Condition Flow (cfs)	Required Concrete Pipe Size (in)	Existing Pipe Size (in)	Future Development Flow (cfs)	Required PVC Pipe Size (in)
25-year flow (cfs)	7.77	12	12	24.64	18
100-year flow (cfs)	11.96	15		31.61	21

**Table 2: Flow and Pipe Size Summary
from Combined Flow to Blackmans Lake**

Combined Flow to Blackmans Lake Inlet					
	Existing Condition Flow (cfs)	Required PVC Pipe Size (in)	Existing Pipe Size (in)	Future Development Flow (cfs)	Required PVC Pipe Size (in)
25-year flow (cfs)	45.43	21	24	51.57	21
100-year flow (cfs)	59.60	24		65.82	24

Results:

Results and calculations for each area are attached.

The minimum pipe size to convey the existing 25-year flow from the detention pond is a 12-inch pipe. Due to the known flooding issues along Park Avenue between 19th Street and 18th Street, it is recommended that the pipe conveying the flow from the detention pond to Blackmans Lake be sized for the future development 100-year peak flow, 18-inch to 24-inch pipe. The pipe would be placed in along the side of the road and out of the drive path. The City's Design and

Construction Standards allow PVC (SDR35) in the right-of-way and is a reasonable pipe material to be used (City of Snohomish, 2004).

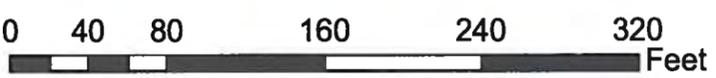

For the fully developed, detention facilities would be required in accordance with the SMMWW. The soil in the area is hydrologic soil group C and there is minimal infiltration, therefore limited LID options will be available for use. With detention used for future development, a 24-inch pipe sized for the 100-year flow for the existing land use conditions is anticipated to be adequately sized for the flow from the detention pond to Blackmans Lake.

Total Volume of Runoff¹ = 220,310 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Detention Pond Upstream of Blackmans Lake - Existing
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 55.04 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 34.4 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 48.13 acres Area = 6.91 acres
 CN = 73 CN = 98
 S = 3.70 S = 0.20
 0.2S = 0.74 0.2S = 0.04

SUMMARY	
Tpk(hrs)	= 7.83
Tc (min)	= 34.4
Qpk(cfs)	= 11.96
Vol(cf)	= 309,478

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1269
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 309,478 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

 Future Det Pond, 25 yr flow, PVC, S=5%

 Project Description

Friction Method	Manning Formula

City of Snohomish
 Stormwater Comprehensive Plan
 Time of Concentration
 Blackmans - Future-Det Pond

Calculate Time of Concentration (Tc)

$$T_c = \text{Sum}(T_t)$$

Where:

$$T_t = \text{travel time (min)} = \frac{L}{(60 \times V)} \quad (\text{for shallow concentrated flow or channel flow})$$

$$T_t = \text{travel time (min)} = \frac{0.42(n_s L)^{0.8}}{(P_2)^{0.5} (s_o)^{0.4}} \quad (\text{for sheet flow})$$

Where:

$$V = \text{avg. velocity (ft/s)} = V = k(s_o)^{0.5}$$

k = time of concentration velocity factor (ft/s)

L = flow length (ft)

n_s = sheet flow Manning's effective roughness coefficient

P_2 = 2-year, 24-hour rainfall (in)

s_o = slope of hydraulic grade line (land slope, ft/ft)

	L (ft)	$k_{s/c}$	V (fps)	n_s	P_2	s_o (ft/ft)	Tt (min)
a - sheet	100	NA	NA	0.24	1.8	0.030	16.2
b - channel	2600	42	5.9	NA	NA	0.02	7.3
Total (Tc)							23.5

Minimum Allowable Tc = 6.0 minutes

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Detention Pond Upstream of Blackmans Lake - Future
 Storm Event: 25-YEAR, 24-HOUR
 Given:

Area = 55.04 acres
 Pt = 3.05 inches
 dt = 10 min.
 Tc = 23.5 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 28.58 acres Area = 26.47 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk (hrs)	= 7.83
Tc (min)	= 23.5
Qpk (cfs)	= 24.64
Vol (cf)	= 442,327

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2 / (Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1754
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 442,327 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Detention Pond Upstream of Blackmans Lake - Future
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 55.04 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 23.5 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 28.58 acres Area = 26.47 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk(hrs)	= 7.83
Tc (min)	= 23.5
Qpk(cfs)	= 31.61
Vol(cf)	= 562,521

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1754
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 562,521 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

Existing Blackmans, 25 yr flow, PVC, S=6.8%

Project Description

City of Snohomish
Stormwater Comprehensive Plan
Time of Concentration
Blackmans - Existing-Lake

Calculate Time of Concentration (Tc)

$$T_c = \text{Sum}(T_t)$$

Where:

$$T_t = \text{travel time (min)} = \frac{L}{(60 \times V)} \quad (\text{for shallow concentrated flow or channel flow})$$

$$T_t = \text{travel time (min)} = \frac{0.42(n_s L)^{0.8}}{(P_2)^{0.5} (s_o)^{0.4}} \quad (\text{for sheet flow})$$

Where:

$$V = \text{avg. velocity (ft/s)} = V = k(s_o)^{0.5}$$

k = time of concentration velocity factor (ft/s)

L = flow length (ft)

n_s = sheet flow Manning's effective roughness coefficient

P_2 = 2-year, 24-hour rainfall (in)

s_o = slope of hydraulic grade line (land slope, ft/ft)

	L (ft)	$k_{s/c}$	V (fps)	n_s	P_2	s_o (ft/ft)	Tt (min)
a - sheet	100	NA	NA	0.24	1.8	0.030	16.2
b - channel	195	17	2.9	NA	NA	0.030	1.1
c - channel	2445	42	10.3	NA	NA	0.06	4.0
Total (Tc)							21.2

Minimum Allowable Tc = 6.0 minutes

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1908
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 796,753 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Blackmans Lake - Existing
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 108.65 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 21.2 min.

PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 75.64 acres Area = 33.01 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
T _{pk} (hrs)	= 7.83
T _c (min)	= 21.2
Q _{pk} (cfs)	= 59.60
Vol(cf)	= 1,028,870

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1908
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 1,028,870 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

 Future-Blackmans, 25 yr flow, PVC, S=6.8%

Project Description

Friction Method	Manning Formula
Solve For	Full Flow Diameter

Input Data

Roughness Coefficient	0.010	
Channel Slope	0.06800	ft/ft
Normal Depth	1.72	ft
Diameter	1.72	ft
Discharge	51.57	ft ³ /s

Results

Diameter	1.72	ft
Normal Depth	1.72	ft
Flow Area	2.33	ft ²
Wetted Perimeter	5.41	ft
Hydraulic Radius	0.43	ft
Top Width	0.00	ft
Critical Depth	1.72	ft
Percent Full	100.0	%
Critical Slope	0.06549	ft/ft
Velocity	22.11	ft/s
Velocity Head	7.60	ft
Specific Energy	9.32	ft
Froude Number	0.00	
Maximum Discharge	55.47	ft ³ /s
Discharge Full	51.56	ft ³ /s
Slope Full	0.06802	ft/ft
Flow Type	SubCritical

City of Snohomish
Stormwater Comprehensive Plan
Time of Concentration
Blackmans - Future-Lake

Calculate Time of Concentration (Tc)

$$T_c = \text{Sum}(T_t)$$

Where:

$$T_t = \text{travel time (min)} = \frac{L}{(60 \times V)} \quad (\text{for shallow concentrated flow or channel flow})$$

$$T_t = \text{travel time (min)} = \frac{0.42(n_s L)^{0.8}}{(P_2)^{0.5} (s_o)^{0.4}} \quad (\text{for sheet flow})$$

Where:

$$V = \text{avg. velocity (ft/s)} = V = k(s_o)^{0.5}$$

k = time of concentration velocity factor (ft/s)

L = flow length (ft)

n_s = sheet flow Manning's effective roughness coefficient

P_2 = 2-year, 24-hour rainfall (in)

s_o = slope of hydraulic grade line (land slope, ft/ft)

	L (ft)	$k_{s/c}$	V (fps)	n_s	P_2	s_o (ft/ft)	Tt (min)
a - sheet	100	NA	NA	0.24	1.8	0.030	16.2
b - channel	195	17	2.9	NA	NA	0.030	1.1
c - channel	2445	42	10.3	NA	NA	0.06	4.0
Total (Tc)							21.2

Minimum Allowable Tc = 6.0 minutes

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Blackmans Lake - Future
 Storm Event: 25-YEAR, 24-HOUR
 Given:

Area = 108.65 acres
 Pt = 3.05 inches
 dt = 10 min.
 Tc = 21.2 min.

PERVIOUS AREA IMPERVIOUS AREA (Roads)
 Area = 51.85 acres Area = 56.80 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk (hrs)	= 7.83
Tc (min)	= 21.2
Qpk (cfs)	= 51.57
Vol (cf)	= 892,533

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2 / (Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1908
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 892,533 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Blackmans Lake - Future
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 108.65 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 21.2 min.

PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 51.85 acres Area = 56.80 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk(hrs)	= 7.83
Tc (min)	= 21.2
Qpk(cfs)	= 65.82
Vol(cf)	= 1,131,318

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.1908
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 1,131,318 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

Table 2.2

PUD's, condos, apartments, commercial businesses, industrial areas & subdivisions < 50 acres	%impervious must be computed		Separate curve numbers shall be selected for pervious and impervious portions of the site	
For a more detailed and complete description of land use curve numbers refer to chapter two (2) of the Soil Conservation Service's Technical Release No. 55, (210-VI-TR-55, Second Ed., June 1986).				

¹ Composite CN's may be computed for other combinations of open space cover type.

² Where roof runoff and driveway runoff are infiltrated or dispersed according to the requirements in Chapter 3, the average percent impervious area may be adjusted in accordance with the procedure described under "Flow Credit for Roof Downspout Infiltration" (Section 3.1.1), and "Flow Credit for Roof Downspout Dispersion" (Section 3.1.2).

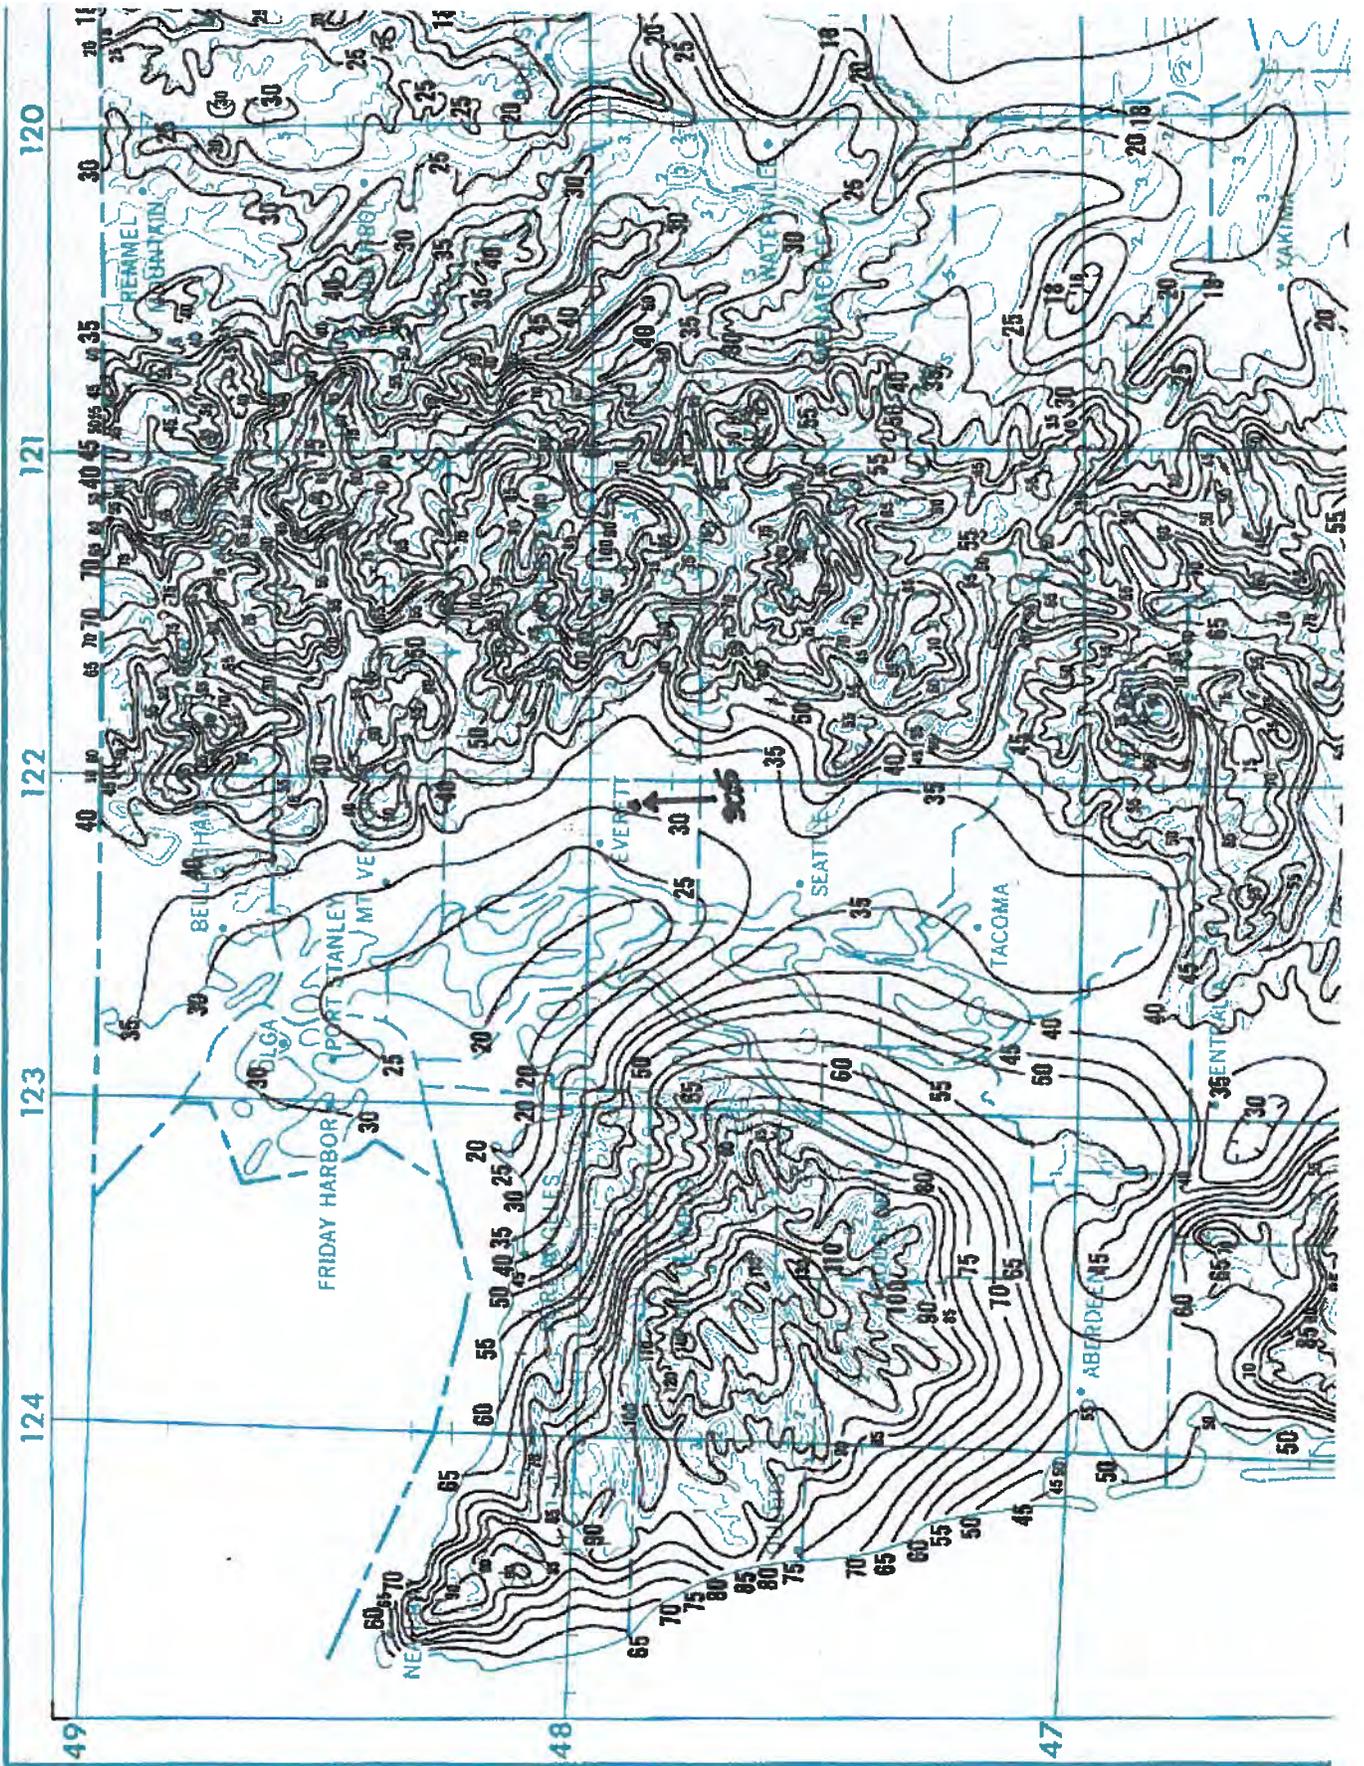

³ Assumes roof and driveway runoff is directed into street/storm system.

⁴ All the remaining pervious area (lawn) are considered to be in good condition for these curve numbers.

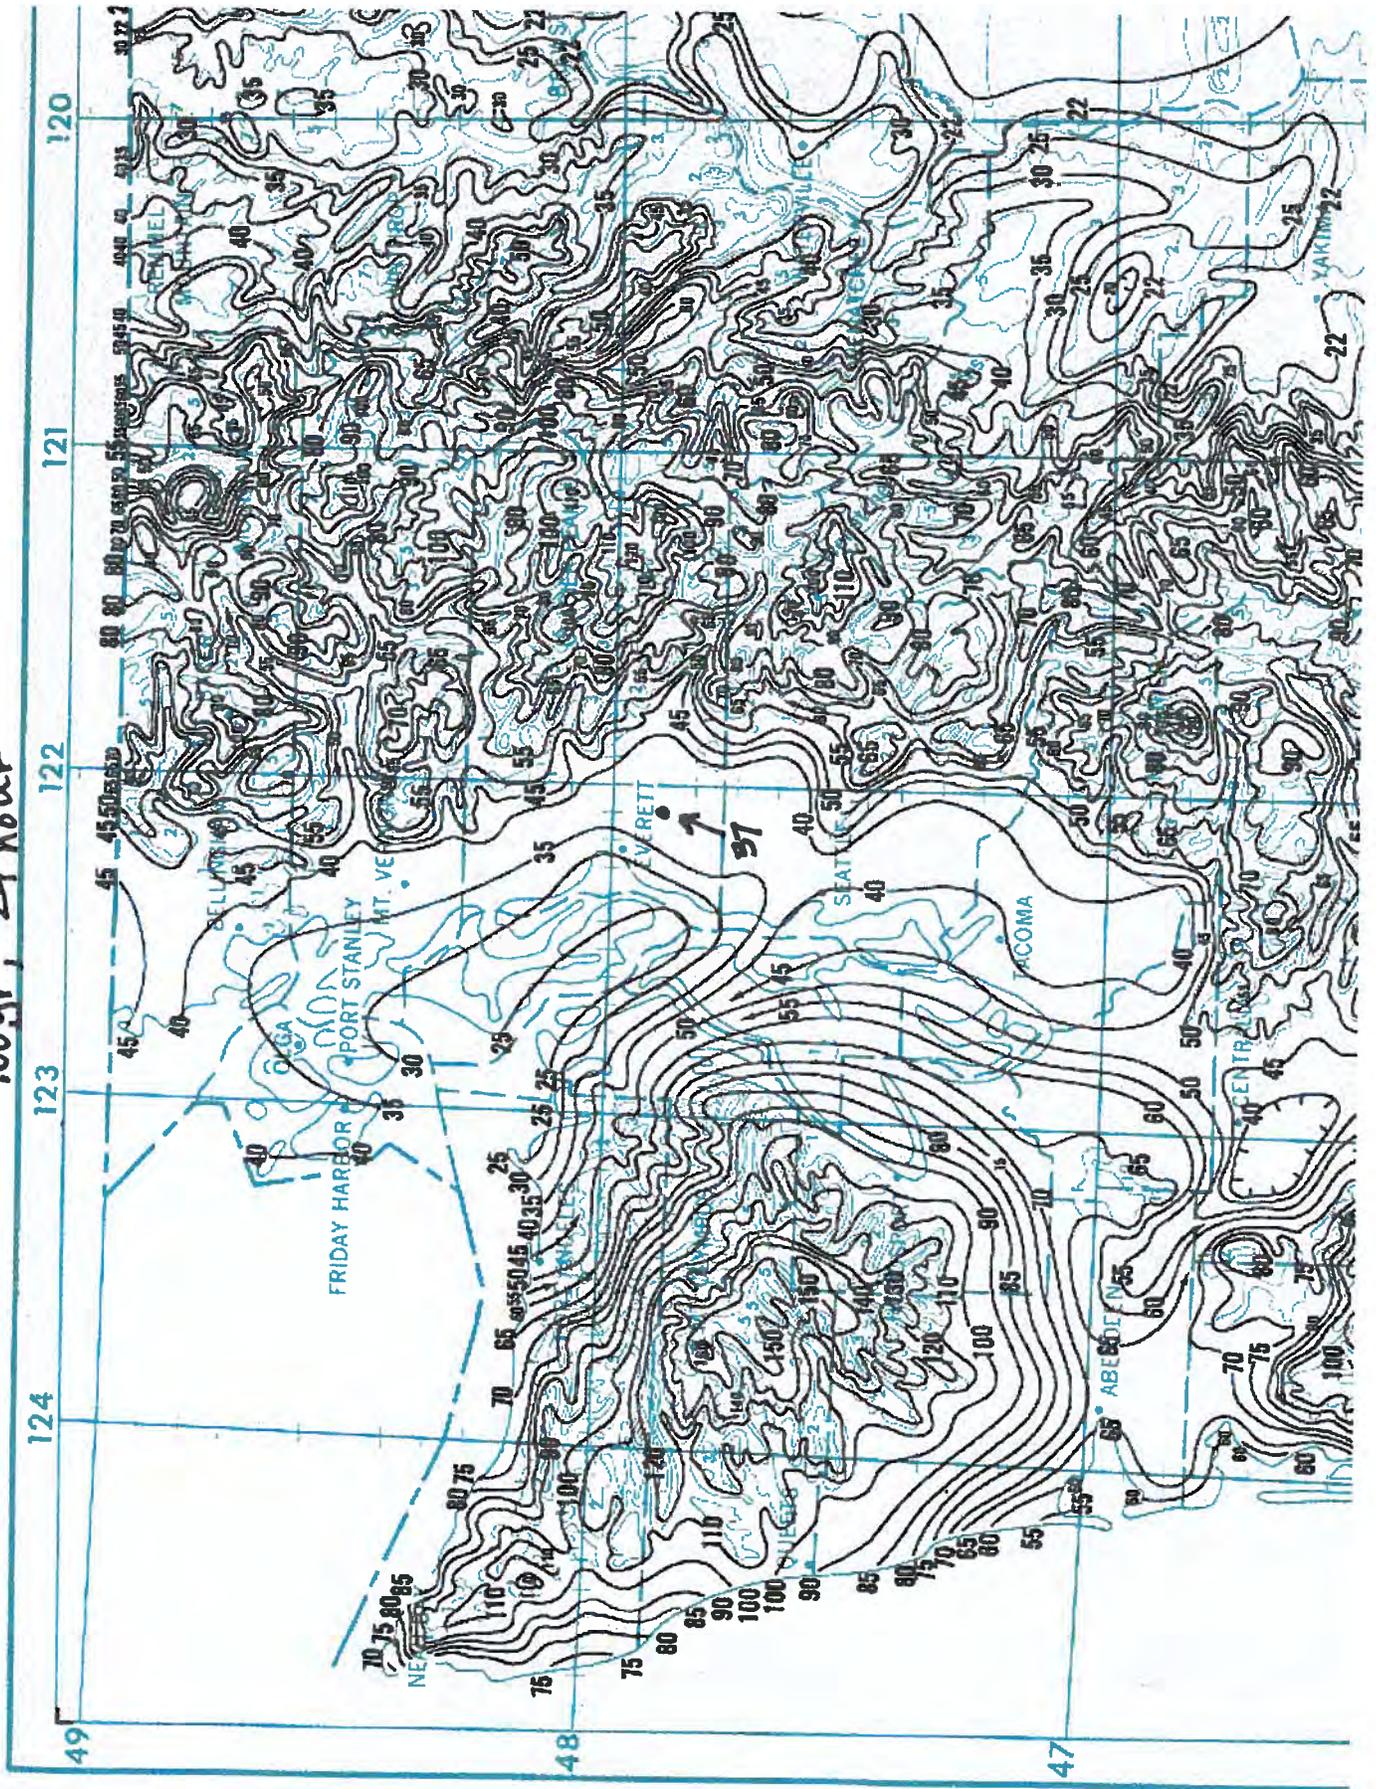

Table 4.4.1 Values of “n” and “k” for use in computing Time of Concentration

FOR SHEET FLOW	n_s
Smooth surfaces (concrete, asphalt, gravel, or bare hard soil)	0.011
Fallow fields of loose soil surface (no vegetal residue)	0.05
Cultivated soil with crop residue (slope < 0.20 ft/ft)	0.06
Cultivated soil with crop residue (slope > 0.20 ft/ft)	0.17

Discipline: Hydraulics

Title of Calculation: Stormwater Conveyance - 16th Street / Terrace and Maple Ave

Calculation Originator: Gina Franco

Calculation Contributors: Tobey Clarkin

Calculation Checker: Carla Talich

DESCRIPTION & PURPOSE

Determine the land use and area that contributes to locations identified by the city that need to be upgraded from a ditch to a pipe. Find the peak flows in these areas and size a pipe to convey the 25year peak flow.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

Project Statement:

There are currently ditches that connect stormwater conveyance pipes within the storm system in the City of Snohomish. There are two locations, 16th/Terrace and Maple Avenue, where the City plans to replace the ditch and install stormwater conveyance pipe in the right-of-way. See attached calculations for a map with both locations identified.

Land Use and Contributing Area:

The existing land use and contributing areas were calculated using 2011 City Land Use Map (City of Snohomish, 2010) and 2007 LiDAR data in ARCGIS. The single family residential land use was assumed to be multifamily (50% pervious and 50% impervious). The area is mostly developed and may fall under high density residential land use. The medium density residential land use was assumed to be 90% pervious and 10% impervious (Taylor, 1993). Further refinement of land use may be conducted during the design phase. The pervious portions were assumed to be in good condition with grass cover on more than 75% of the area, resulting in a curve number of 86. The right-of-way area was assumed to be paved, with a curve number of 98.

The contributing areas to the 16th/Terrace pipe also contribute to the Maple Avenue pipe. The two areas were analyzed separately to determine time of concentration and peak flows. The peak flow from the 16th/Terrace and from Maple Avenue area were added together to check the capacity of the 12-inch pipe connection in Maple Avenue. The land use areas calculated in ARCGIS were separated into pervious and impervious areas for input into the Santa Barbara Urban Hydrograph (SBUH) spreadsheet. See attached calculations.

Pipe Sizing:

The new stormwater conveyance pipes were sized based on Section 4-2.2 of the Design and Construction Standards set forth by the City of Snohomish, by computing the peak flow resulting from the 24-hour duration, 25- and 100-year recurrence interval storms (City of Snohomish, 2004), using the SBUH method. A Type 1A unit hydrograph was used, as appropriate for western Washington. The precipitation for the 25- and 100-year storm events was determined by using NOAA Atlas 2 isopluvial maps.

A detention pipe system is to be located in Terrace Avenue between 15th Street and 16th Street; the sizing of a new detention pipe will be done as a separate calculation package.

The size of the pipes was based on the peak flows calculated using the SBUH method. Bentley Systems, Inc. FlowMaster, 2008 software was used to size the pipes. The pipes were graded so that they can gravity drain to the connection point. There was a minimum of three feet of cover over the pipes; therefore, polyvinyl chloride (PVC) was feasible. Slopes ranging from 4% to 6% were checked using the peak flows from the 25- and the 100-year storm events. The slope at 16th/Terrace was determined using existing manhole rim elevations, see attached sketch. The slope at Maple Avenue was determined using the topography; see Figure C3 in the Stormwater Comprehensive Plan.

It was determined that a 12-inch PVC pipe would be adequate for the 25-year storm event and may surcharge at the 100-year storm event. The drainage in this area is contained within a manmade system and erosion is not likely to occur.

Results:

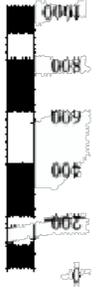

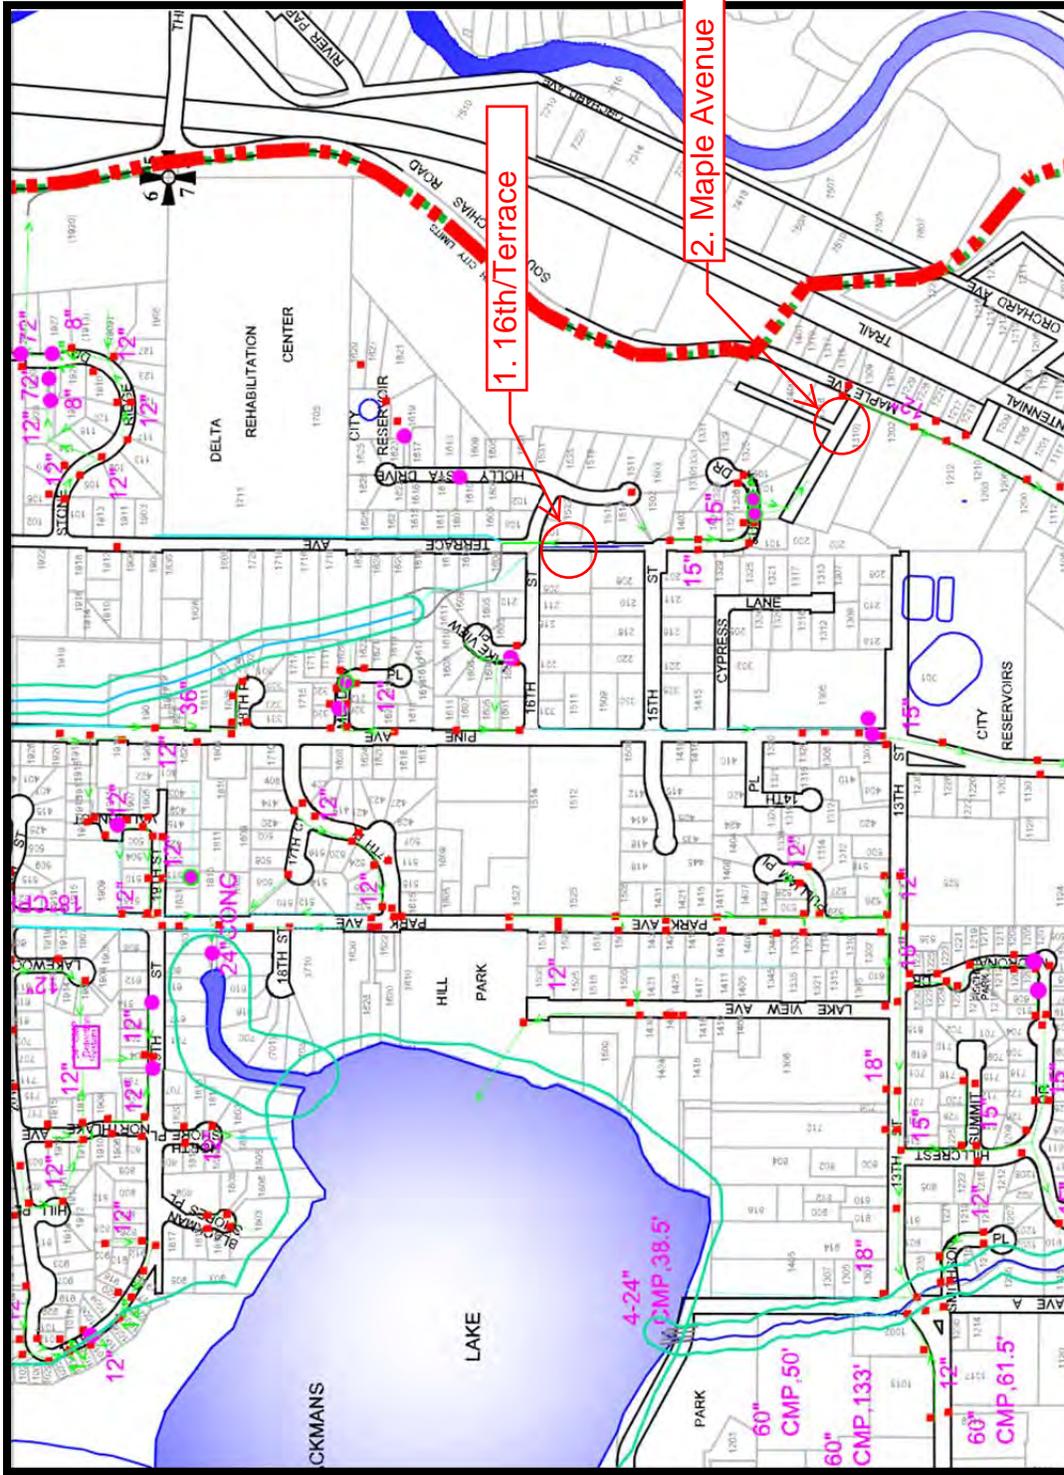

Based on the calculations described above, it is recommended that a 12-inch diameter PVC pipe used for both systems: 16th/Terrace and the Maple Avenue. Results and calculations are attached.

Total Volume of Runoff¹ = 201,578 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: 16th / Terrace
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 26.43 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 47.7 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 15.77 acres Area = 10.66 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
T _{pk} (hrs)	= 7.83
T _c (min)	= 47.7
Q _{pk} (cfs)	= 10.91
Vol(cf)	= 258,096

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.0949
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 258,096 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

Existing Maple Ave, 25 yr flow, PVC

Project Description

Friction Method Manning Formula
Solve For Channel Slope

Input Data

Roughness Coefficient	0.010
Normal Depth	1.00 ft
Diameter	1.00 ft
Discharge	12.89 ft ³ /s

The 25-yr flow was used to determine the slope of the pipe that would be able to contain the design flow in a 12-inch diameter pipe.

Results

Channel Slope	0.07746 ft/ft
Flow Area	0.79 ft ²
Wetted Perimeter	3.14 ft
Hydraulic Radius	0.25 ft
Top Width	0.00 ft
Critical Depth	1.00 ft
Percent Full	100.0 %
Critical Slope	0.07443 ft/ft
Velocity	16.41 ft/s
Velocity Head	4.19 ft
Specific Energy	5.19 ft
Froude Number	0.00
Maximum Discharge	13.87 ft ³ /s
Discharge Full	12.89 ft ³ /s
Slope Full	0.07746 ft/ft
Flow Type	SubCritical

The minimum pipe slope for a 12-inch diameter pipe, is 7.7%. Based on the topography of the land (See Figure C3 of the report) the average slope is 18%.

GVF Input Data

Downstream Depth	0.00 ft
Length	0.00 ft
Number Of Steps	0

GVF Output Data

Upstream Depth	0.00 ft
Profile Description	
Profile Headloss	0.00 ft
Average End Depth Over Rise	0.00 %
Normal Depth Over Rise	100.00 %
Downstream Velocity	Infinity ft/s

City of Snohomish
Stormwater Comprehensive Plan
Time of Concentration
Maple Ave

Calculate Time of Concentration (Tc)

$$T_c = \text{Sum}(T_t)$$

Where:

$$T_t = \text{travel time (min)} = \frac{L}{(60 \times V)} \quad (\text{for shallow concentrated flow or channel flow})$$

$$T_t = \text{travel time (min)} = \frac{0.42(n_s L)^{0.8}}{(P_2)^{0.5} (s_o)^{0.4}} \quad (\text{for sheet flow})$$

Where:

$$V = \text{avg. velocity (ft/s)} = V = k(s_o)^{0.5}$$

k = time of concentration velocity factor (ft/s)

L = flow length (ft)

n_s = sheet flow Manning's effective roughness coefficient

P_2 = 2-year, 24-hour rainfall (in)

s_o = slope of hydraulic grade line (land slope, ft/ft)

	L (ft)	$k_{s/c}$	V (fps)	n_s	P_2	s_o (ft/ft)	Tt (min)
a - sheet	90	NA	NA	0.24	1.8	0.055	11.7
b - channel	1240	42	10.3	NA	NA	0.06	2.0
Total (Tc)							13.7

Minimum Allowable Tc = 6.0 minutes

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Maple Avenue
 Storm Event: 25-YEAR, 24-HOUR
 Given:

Area = 8.08 acres
 Pt = 3.05 inches
 dt = 10 min.
 Tc = 13.7 min.
 PERVIOUS AREA IMPERVIOUS AREA
 (Roads)
 Area = 3.31 acres Area = 4.77 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk (hrs)	= 7.83
Tc (min)	= 13.7
Qpk (cfs)	= 4.49
Vol (cf)	= 68,825

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2 / (Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.2674
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 68,825 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft/s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

SANTA BARBARA URBAN HYDROGRAPH (SBUH) METHOD
 RUNOFF VOLUME CALCULATION

Project: City of Snohomish - Stormwater Comp Plan
 Basin: Maple Avenue
 Storm Event: 100-YEAR, 24-HOUR
 Given:

Area = 8.08 acres
 Pt = 3.70 inches
 dt = 10 min.
 Tc = 13.7 min.

PERVIOUS AREA IMPERVIOUS AREA
 (Roads)

Area = 3.31 acres Area = 4.77 acres
 CN = 86 CN = 98
 S = 1.63 S = 0.20
 0.2S = 0.33 0.2S = 0.04

SUMMARY	
Tpk(hrs)	= 7.83
Tc (min)	= 13.7
Qpk(cfs)	= 5.68
Vol(cf)	= 86,795

Compute: Runoff Hydrograph

Column (3) = SCS Type IA Rainfall Distribution
 Column (4) = Col. (3) x Pt
 Column (5) = Accumulated Sum of Col. (4)
 Column (6) = [If P <= 0.2S] = 0; Note, use PERVIOUS Area "S" value.
 [If P > 0.2S] = (Col.(5) - 0.2S)^2/(Col.(5) + 0.8S); Using the PERVIOUS Area "S" value.
 Column (7) = Col.(6) of Present Time Step - Col.(6) of Previous Time Step
 Column (8) = Same method as for Col.(6), except use the IMPERVIOUS Area "S" value.
 Column (9) = Col.(8) of the present time step - Col.(8) of the previous time step.
 Column (10) = ((PERVIOUS area / Total area) x Col.(7)) + ((IMPERVIOUS area / Total area) x Col.(9))
 Column (11) = (60.5 x Col.(10) x Total Area) / 10 (dt = 10 minutes)
 Routing Constant, w = dt / (2Tc + dt) = 0.2674
 Column (12) = Col.(12) of Previous Time Step + (w x [Col.(11) of Previous Time Step
 + Col.(11) of Present Time Step - (2 x Col.(12) of Previous Time Step)])

Total Volume of Runoff¹ = 86,795 cu. ft.

Notes:

1. Total Runoff Volume is found by summing column (12) and multiplying by the time step, dt as follows:

$$V = \text{Sum}Q \times dt$$

$$V(\text{cu.ft.}) = \text{Sum}Q(\text{cu.ft./s}) \times dt(\text{min.}) \times (60 \text{ s/min.})$$

Table 2.2				
Runoff Curve Numbers for Selected Agricultural, Suburban, and Urban Areas				
(Sources: TR 55, 1986, and Stormwater Management Manual, 1992. See Section 2.1.1 for explanation)				
CNs for hydrologic soil group				
Cover type and hydrologic condition.	A	B	C	D
Curve Numbers for Pre-Development Conditions				
Pasture, grassland, or range-continuous forage for grazing:				
Fair condition (ground cover 50% to 75% and not heavily grazed).	49	69	79	84
Good condition (ground cover >75% and lightly or only occasionally grazed)	39	61	74	80
Woods:				
Fair (Woods are grazed but not burned, and some forest litter covers the soil).	36	60	73	79
Good (Woods are protected from grazing, and litter and brush adequately cover the soil).	30	55	70	77
Curve Numbers for Post-Development Conditions				
Open space (lawns, parks, golf courses, cemeteries, landscaping, etc.)¹				
Fair condition (grass cover on 50% - 75% of the area).	77	85	90	92
Good condition (grass cover on >75% of the area)	68	80	86	90
Impervious areas:				
Open water bodies: lakes, wetlands, ponds etc.	100	100	100	100
Paved parking lots, roofs ² , driveways, etc. (excluding right-of-way)	98	98	98	98
Permeable Pavement (See Appendix C to decide which condition below to use)				
Landscaped area	77	85	90	92
50% landscaped area/50% impervious	87	91	94	96
100% impervious area	98	98	98	98
Paved	98	98	98	98
Gravel (including right-of-way)	76	85	89	91
Dirt (including right-of-way)	72	82	87	89
Pasture, grassland, or range-continuous forage for grazing:				
Poor condition (ground cover <50% or heavily grazed with no mulch).	68	79	86	89
Fair condition (ground cover 50% to 75% and not heavily grazed).	49	69	79	84
Good condition (ground cover >75% and lightly or only occasionally grazed)	39	61	74	80
Woods:				
Poor (Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning).	45	66	77	83
Fair (Woods are grazed but not burned, and some forest litter covers the soil).	36	60	73	79
Good (Woods are protected from grazing, and litter and brush adequately cover the soil).	30	55	70	77
Single family residential³:				
Dwelling Unit/Gross Acre	Should only be used for subdivisions > 50 acres		Average Percent impervious area ^{3,4}	
1.0 DU/GA			15	Separate curve number shall be selected for
1.5 DU/GA			20	pervious & impervious
2.0 DU/GA			25	portions of the site or
2.5 DU/GA			30	basin
3.0 DU/GA			34	
3.5 DU/GA			38	
4.0 DU/GA			42	
4.5 DU/GA			46	
5.0 DU/GA			48	
5.5 DU/GA			50	
6.0 DU/GA			52	
6.5 DU/GA			54	
7.0 DU/GA			56	
7.5 DU/GA			58	
PUD's, condos, apartments, commercial businesses, industrial areas & subdivisions < 50 acres	%impervious must be computed		Separate curve numbers shall be selected for pervious and impervious portions of the site	
For a more detailed and complete description of land use curve numbers refer to chapter two (2) of the Soil Conservation Service's Technical Release No. 55, (210-VI-TR-55, Second Ed., June 1986).				

¹ Composite CN's may be computed for other combinations of open space cover type.

² Where roof runoff and driveway runoff are infiltrated or dispersed according to the requirements in Chapter 3, the average percent impervious area may be adjusted in accordance with the procedure described under "Flow Credit for Roof Downspout Infiltration" (Section 3.1.1), and "Flow Credit for Roof Downspout Dispersion" (Section 3.1.2).

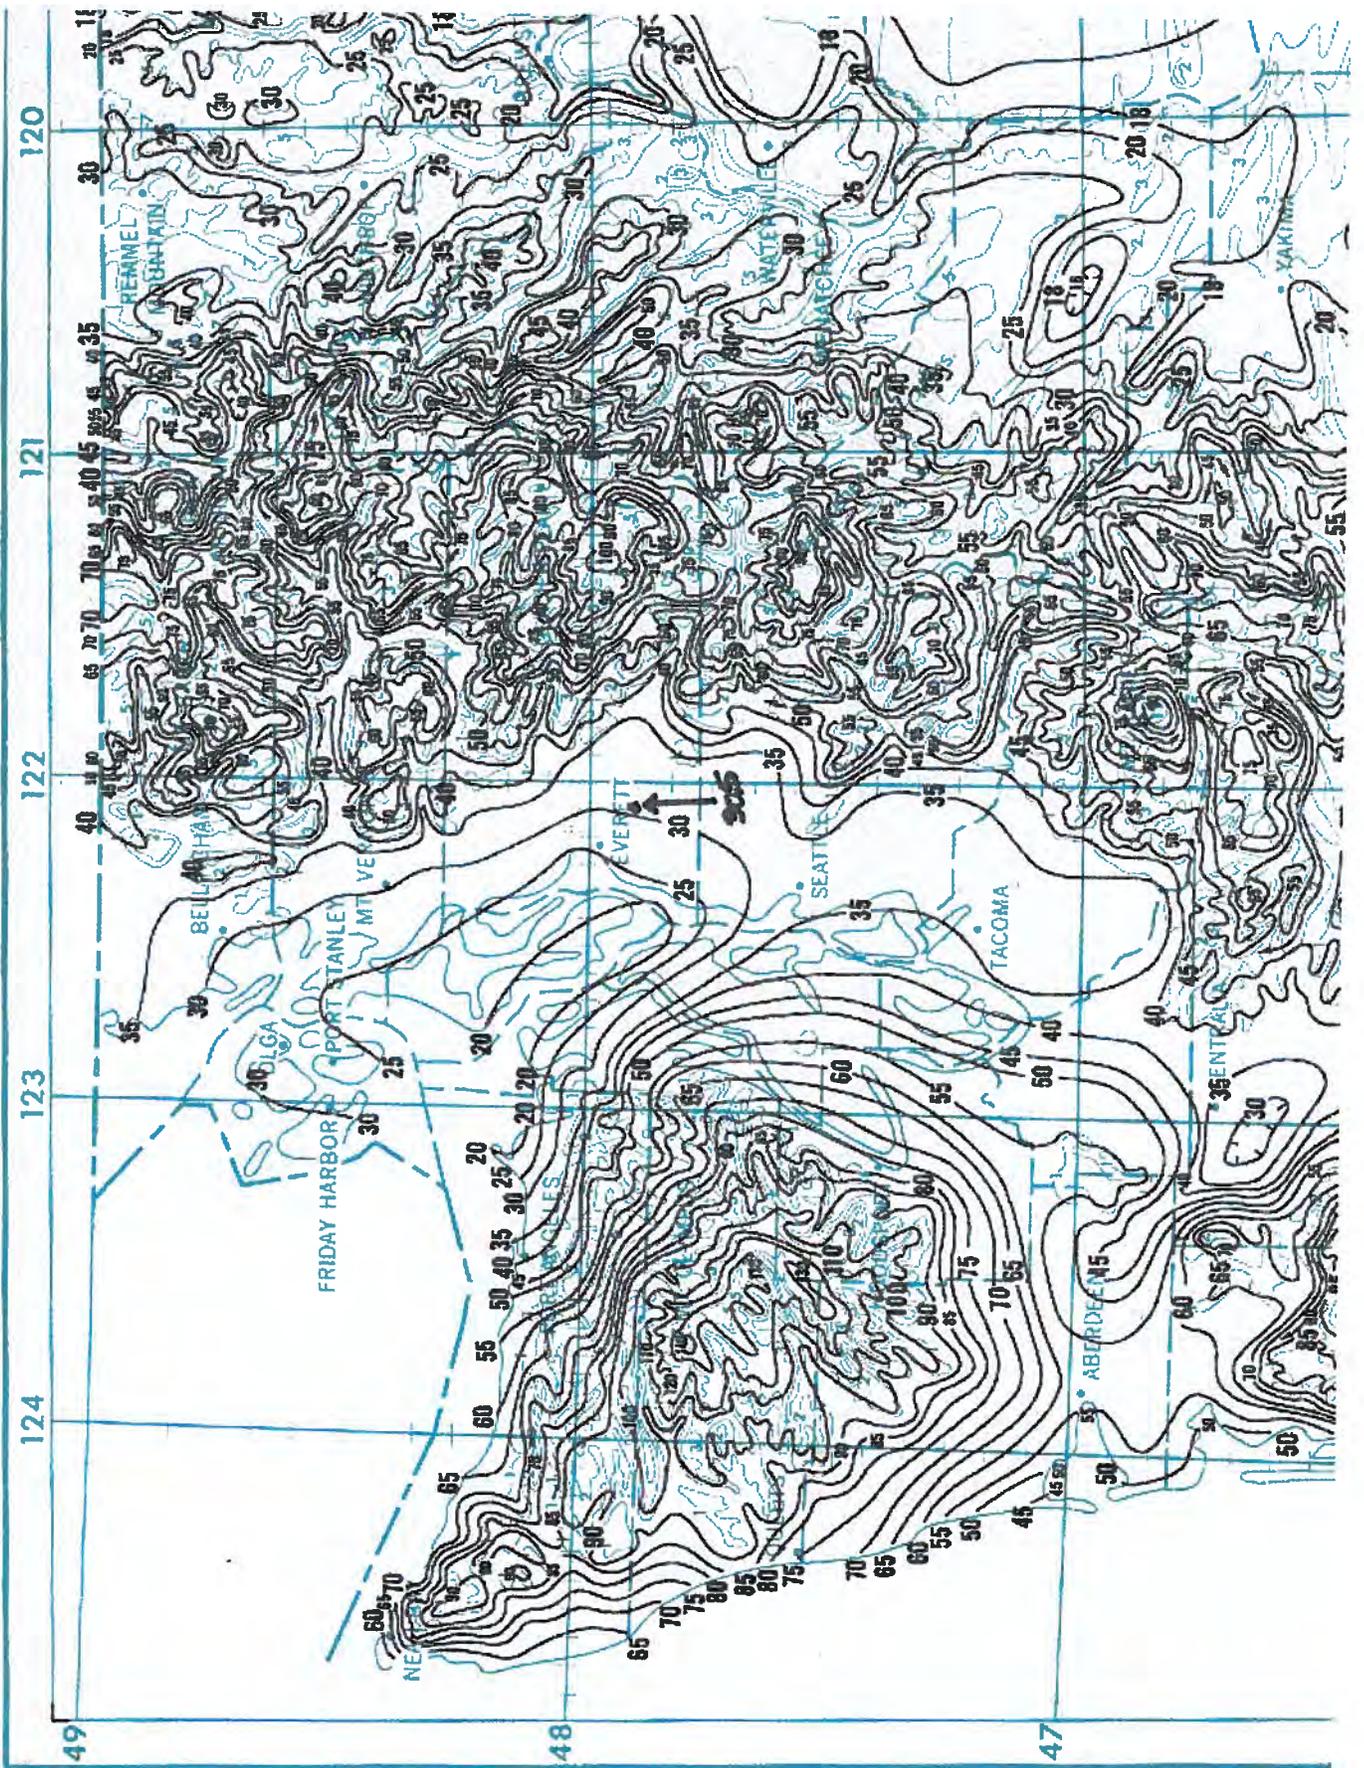

³ Assumes roof and driveway runoff is directed into street/storm system.

⁴ All the remaining pervious area (lawn) are considered to be in good condition for these curve numbers.

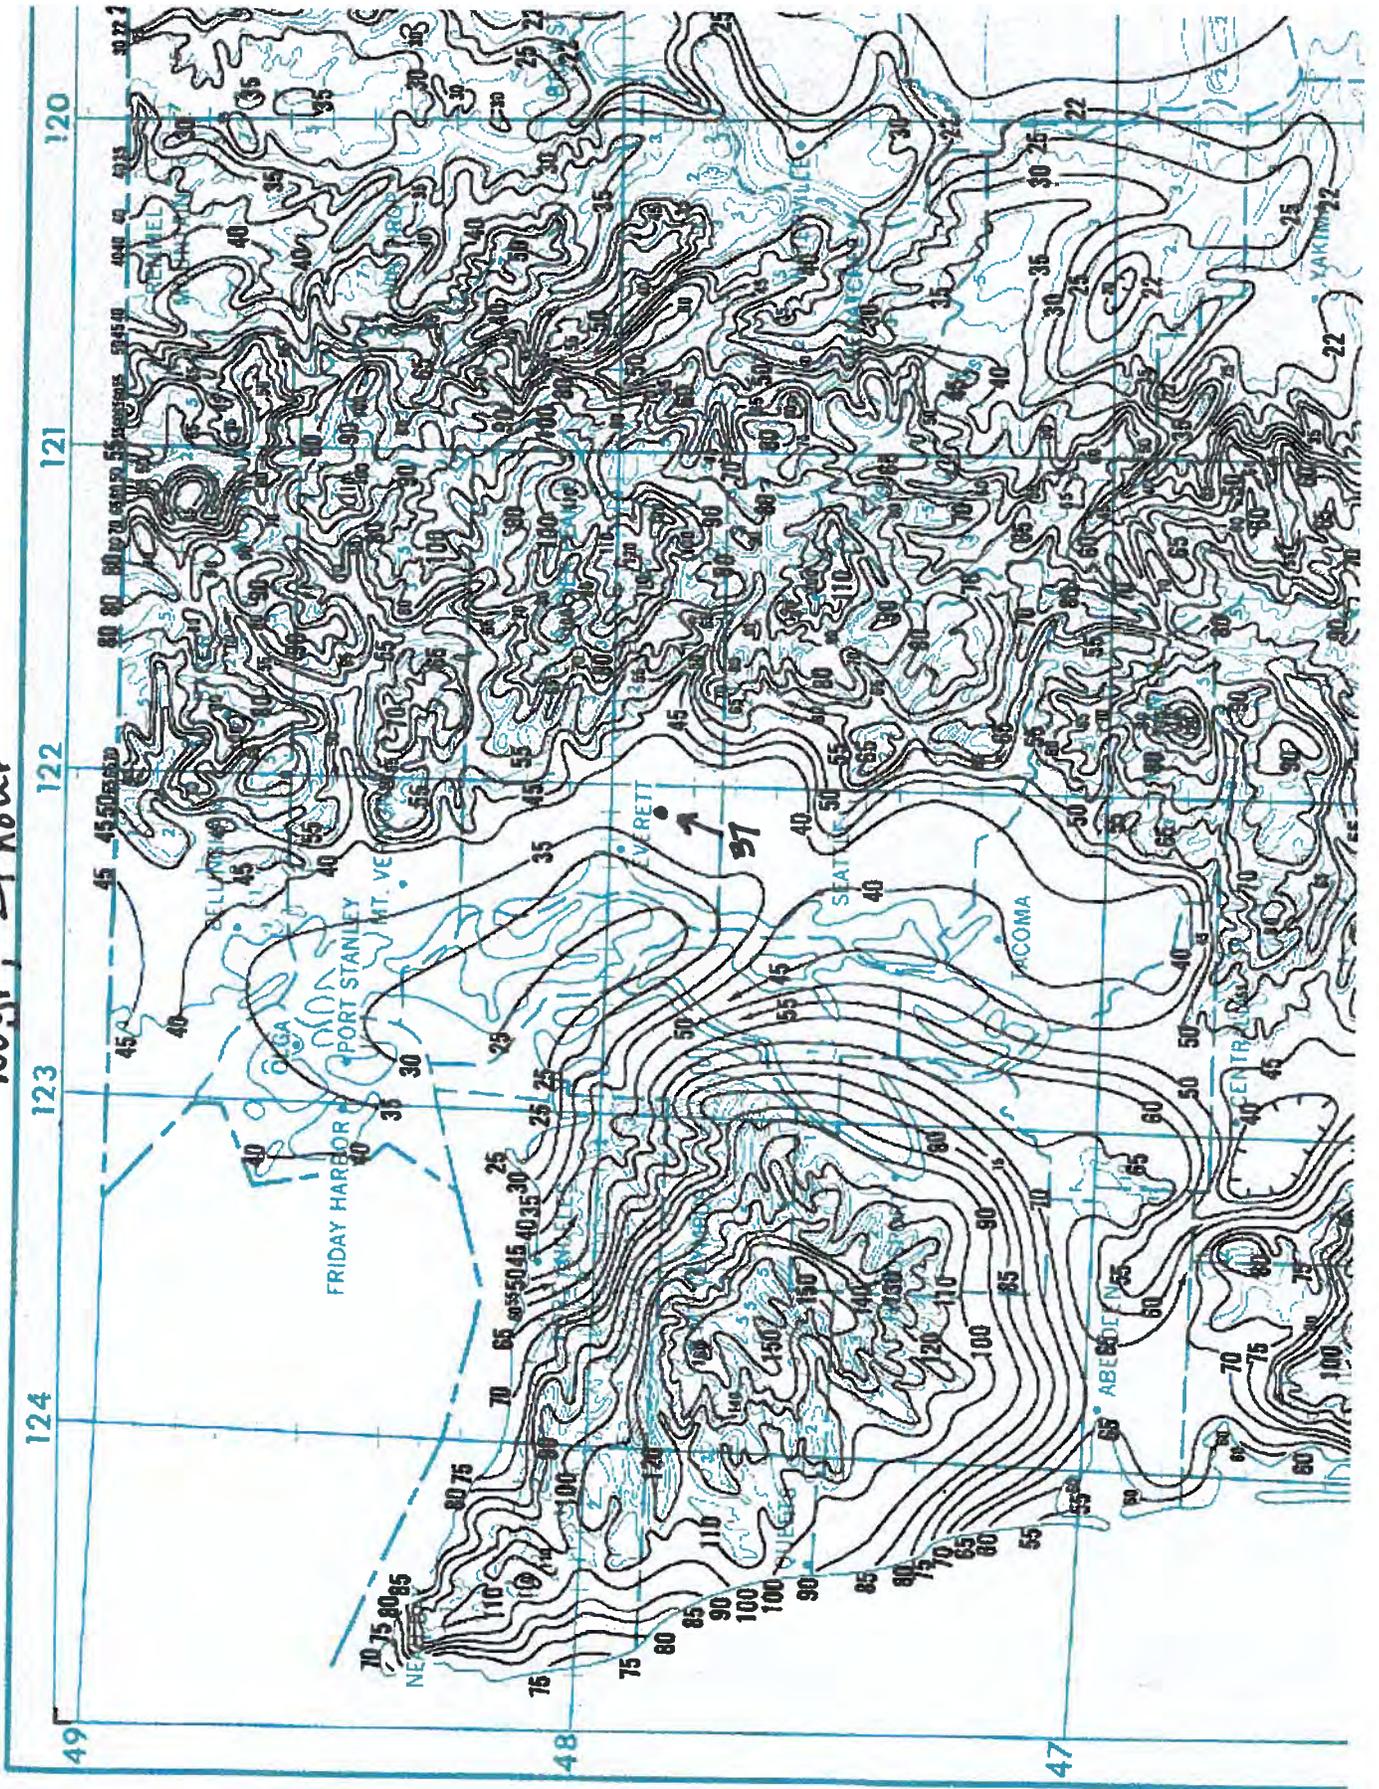

Table 4.4.1 Values of “n” and “k” for use in computing Time of Concentration

FOR SHEET FLOW	n_s
Smooth surfaces (concrete, asphalt, gravel, or bare hard soil)	0.011
Fallow fields of loose soil surface (no vegetal residue)	0.05
Cultivated soil with crop residue (slope < 0.20 ft/ft)	0.06
Cultivated soil with crop residue (slope > 0.20 ft/ft)	0.17
Short prairie grass and lawns	0.15

Detention Facility – 16th and Terrace

Project Name:	Stormwater Comprehensive Plan Update	Project Number:	33763575
Project Location:	City of Snohomish	Client Name:	City of Snohomish
PM Name:	Carla Talich	PIC Name:	Kevin Weed

IDENTIFYING INFORMATION

(This section is to be completed by the Originator.)

Calculation Medium: Electronic File Name: K:\City of Snohomish\Stormwater Comp Plan\Stormwater Modeling - NEW moved\Detention - 16th and Terrace

(Select as appropriate)

Hard-copy

Unique Identification:

Number of pages
(including cover sheet): 8

Discipline: Hydrology

Title of Calculation: Detention Facility - 16th and Terrace

Calculation Originator: C. Talich

Calculation Contributors:

Calculation Checker: John Gillespie

DESCRIPTION & PURPOSE

Use the land use designations within the combined utility area and use WWHM to calculate the water quality volume and flow rates for both on-line and off-line facilities.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

ISSUE / REVISION RECORD

Checker comments, if any, provided on: hard-copy electronic file Form 3-5 (MM)

Project Statement:

Proposed project C-5b includes adding a storm drainage system to the Holly Vista neighborhood to improve stormwater conveyance and reduce flooding on private property. The project also includes replacing an under capacity ditch/swale on private property with a storm drain placed in the unopened Terrace Avenue right-of-way.

Stormwater travels from the Holly Vista neighborhood, through the 16th Street and Terrace Avenue area, through the Suncrest development, and then down the unopened Fairview ROW to a 12-inch diameter stormdrain in Maple Avenue. Based on City mapping, the 12-inch diameter pipe in Maple Avenue is sloped at approximately 1 percent (Attachment 1).

The calculation package entitled, “16th & Terrace - Maple Ave” present land use, hydrologic model input and peak flows for consideration for design of the proposed storm drain pipe improvements. Those calculations do not consider existing or proposed detention facilities.

There is an existing detention facility located within the Suncrest development (Attachment 2). The facility is made up of a 76-foot long, 60-inch diameter detention pipe with Type II catch basins on each end (48-inch diameter upstream and 54-inch diameter downstream).

The purpose of this calculation is to determine if detention storage would be recommended for the proposed project C-5b.

Assumptions:

In accordance with the 2005 Ecology Manual, there is no new development or change in land use associated with this project, so it is assumed that detention facilities would not be required other than to evaluate the downstream, manmade system for flood control considerations.

It is assumed that the Suncrest detention pipe provides adequate storage under the existing condition to provide flood control to the downstream drainage system. There have been no reports of flooding within the 12-inch diameter mainline in Maple Avenue.

The 25-year 24-hour storm was used to evaluate the drainage system upstream of Suncrest and develop a conceptual detention system size.

No storm flow routing was included in this conceptual design. It was assumed that the capacity of the storm drainage pipe in Maple Avenue would be used as the upper threshold for discharge during a 25-year 24-hour storm event at the proposed detention facility within the unopened Terrace Avenue.

Capacity of 12-inch diameter Storm drain in Maple Avenue:

Bentley FlowMaster was used to evaluate the available capacity in the existing 12-inch diameter pipe in Maple Avenue. The available capacity is approximately 5 cfs (Attachment 3).

Detention Sizing

The SBUH calculations prepared for the calculation package entitled, “16th & Terrace - Maple Ave” were modified to allow for a discharge rate of 5 cfs. Time steps with discharge greater

than 5 cfs were separated from the flow analysis. The allowable flow (5 cfs) was subtracted, or allowed to continue downstream, and the remaining flow was stored. The storage volume per time step was added up and the detention storage size was determined. Based on this approach, an 8 foot diameter, 225 foot long detention pipe would be required to control the downstream flow rate to 5 cfs (Attachment 4). The overall contributing watershed (26.43 acres) was then evaluated and it was determined that the area from the Holly Vista and the tight lining of the 16th Street and Terrace Avenue Flow make up much less than 1/2 of the total drainage. No other flooding concerns have been reported in the area. Therefore, for planning purposes, an 8 foot diameter, 100-foot long detention pipe was included in the project estimate. Further analysis, including flow routing for the drainage basin and existing and proposed storm drainage facilities is recommended during the design phase.

Results:

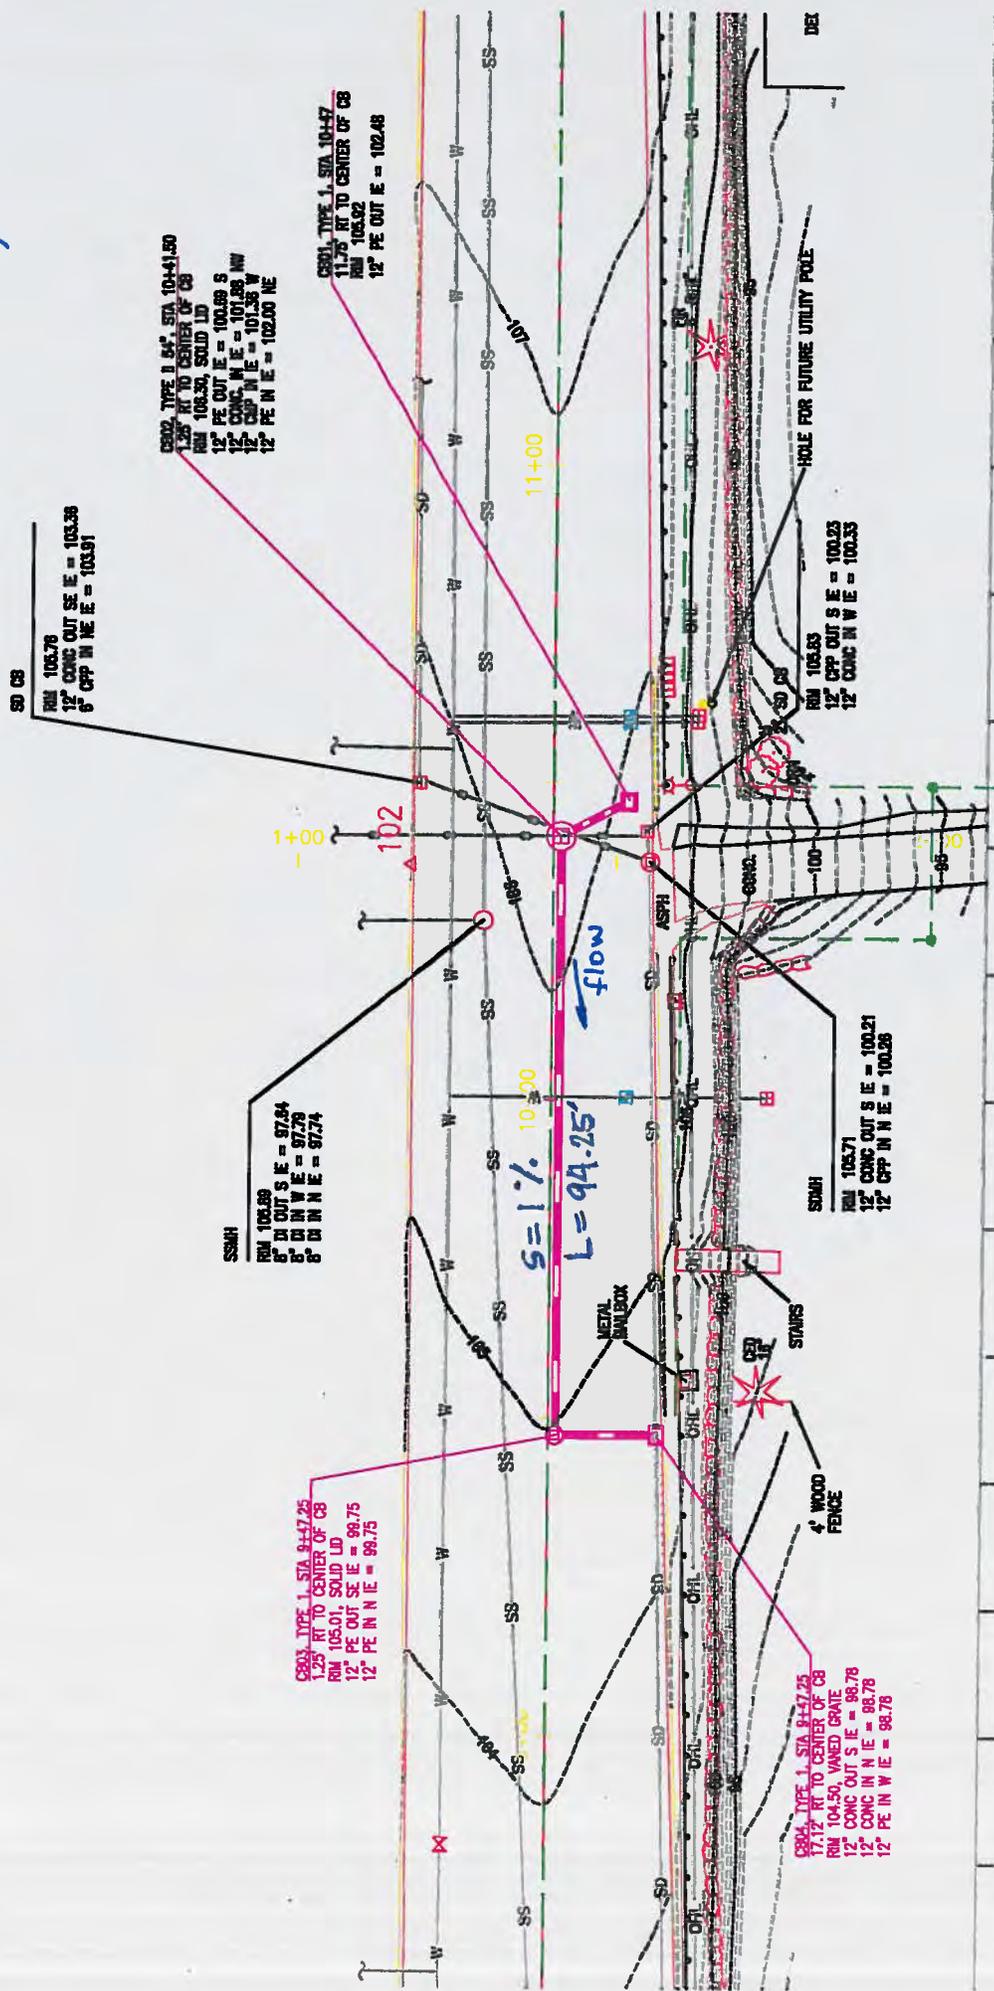

Model results and calculations are attached.

Water Quality Analysis – Combined Sewer Area

Project Name:	Stormwater Comprehensive Plan Update	Project Number:	33763575
Project Location:	City of Snohomish	Client Name:	City of Snohomish
PM Name:	Carla Talich	PIC Name:	Kevin Weed

IDENTIFYING INFORMATION

(This section is to be completed by the Originator.)

Calculation Medium: Electronic File Name: K:\City of Snohomish\Stormwater Comp Plan\Stormwater Modeling - NEW moved\Combined Utility Area

(Select as appropriate)

Hard-copy

Unique Identification:

Number of pages
(including cover sheet): 10

Discipline: Hydrology

Title of Calculation: Water Quality Analysis - Combined Sewer Area

Calculation Originator: Gina Franco

Calculation Contributors:

Calculation Checker: Carla Talich

DESCRIPTION & PURPOSE

Use the land use designations within the combined utility area and use WWHM to calculate the water quality volume and flow rates for both on-line and off-line facilities.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

ISSUE / REVISION RECORD

Checker comments, if any, provided on: hard-copy electronic file Form 3-5 (MM)

No.	Description	P	S	F	Originator Initials	Date	Checker Initials	Date
0	Initial Issue	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	gmf	5/17/13		
1		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	[]	[]	[]	[]
2		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	[]	[]	[]	[]
3		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	[]	[]	[]	[]

Note: For a given Revision No. Check off either P (Preliminary), S (Superseding) or F (Final). If there are no revisions to the Initial Issue check off F (Final). Comments may be provided on the hard-copy calculations, electronic file or on Form 3-5 (MM).

APPROVAL and DISTRIBUTION

The calculations associated with this Cover Sheet have been checked.

Project Statement:

The combined utility basin, as shown on Figure 1 of this report, was analyzed to determine the water quality design volume.

Land Use and Contributing Area:

The contributing land use designation areas were provided by the City Land Use Map (City of Snohomish, 2010). To be conservative the single family residential land use was assumed to be 50 percent pervious and 50 percent impervious. The medium density residential land use was assumed to be 90 percent pervious and 10 percent impervious. The high density residential land use was assumed to be 75 percent pervious and 25 percent impervious (Taylor, 1993). The commercial areas and mixed use land use designations were assumed to be 80 percent impervious and verified by interpretation of the aerial photography. The pervious and impervious area for each designated land use is presented in Table 1.

Table 1: Impervious and Pervious Areas

Land Use Designation	Total Area (ac)	Impervious Area (ac)	Pervious Area (ac)
Commercial Area	32.2	25.76	6.44
Single Family Res	108.97	54.49	54.49
High Density Res	0.42	0.11	0.32
Medium Density Res	14.64	1.46	13.18
ROW	88.47	88.47	0.00
Parks/Open Space	2.05	0.00	2.05
Mixed Use	1.41	1.13	0.28
Total	248.16	171.41	76.75

The total area for each land use designation within the combined utility area is highlighted in Table 3.

Western Washington Hydrology Model (WWHM):

The existing land use designations, in Table 1, are input values into the WWHM model. The pervious input values take into account the hydrologic soil group (HSG) which is classified on Figure 2 of this report as soil type C.

WWHM analyzes the input data and produces a 24-hour water quality volume. The water quality volume calculated by WWHM is based on the 6-month, 24-hour storm event. The water quality 24-hour volume calculated from WWHM is 23.04 acre-feet. WWHM analyzes both the on-line and off-line flow rate. Table 2 provides the water quality results from WWHM.

Table 2: WWHM Results

	15 Minute Flow Rate (cfs)
On-line	32.19
Off-line	18.29

Results:

Results and calculations are attached.

Table 3: Existing Land Use Designations (Acres)

Title of Calculation: Evaluate Conversion of Former Wastewater Lagoon to Water Quality Pond

Calculation Originator: C. Talich

Calculation Contributors:

Calculation Checker: John Gillespie

DESCRIPTION & PURPOSE

Evaluate former wastewater lagoon for conversion to a water quality treatment pond and determine potential upgrades needed.

BASIS / REFERENCE / ASSUMPTIONS

Assumptions are stated on calculation write up.

ISSUE / REVISION RECORD

Checker comments, if any, provided on: hard-copy electronic file Form 3-5 (MM)

Project Statement:

The calculations entitled, “Combined Sewer Basin” was referenced in preparation of this calculation. The purpose of the “Combined Utility Basin” calculation was to determine the water quality design volume and flow rates for the currently zoned condition within the approximately 248 acre combined utility area.

The objective of this calculation is to determine potential upgrades to the former wastewater treatment lagoon that would be needed to convert the existing lagoon into a stormwater treatment pond. The City requested that future build out conditions be considered during this planning phase. To be conservative and to evaluate model sensitivity, the entire area was evaluated as impervious in the Future Build-out condition.

Land Use and Contributing Area:

The contributing land use designation areas were provided by the City Land Use Map (City of Snohomish, 2010). Land use for the current zoning condition is described in the calculation, “Combined Sewer Basin.” The pervious and impervious area for each option evaluated is presented in Table 1.

Table 1: Impervious and Pervious Areas

Zoning Condition Evaluated	Total Area (ac)	Impervious Area (ac)	Pervious Area (ac)
Current Zoning	248.16	171.41	76.75
Future Build-out	248	248	0

Western Washington Hydrology Model (WWHM):

The existing land use designations, in Table 1, were input into the WWHM model. The pervious area was classified as hydrologic soil group (HSG) C, or till. The water quality volume calculated by WWHM correlates to the 6-month, 24-hour storm event. Table 2 provides the water quality modeling results from WWHM for a Basic Wetpond for the current zoning condition and the future complete built-out scenario.

The Ecology Manual describes two types of wetponds, basic and large. For the basic wetpond, the designed wetpool volume is the total volume of runoff from the water quality design storm (the 6-month, 24-hour storm event). Large wetponds are designed for higher levels of pollutant removal. A large wetpond requires a wetpool volume at least 1.5 times larger than the total volume of runoff from the 6-month, 24-hour storm. During design, influent water quality should be evaluated. Table 2 also provides the size of the large wetpond that would be needed for the future build-out condition.

Table 2: WWHM Results

Zoning Condition Evaluated	Water Quality Volume (ac-ft)	On-line 15 Minute Flow Rate (cfs)	Off-line 15 Minute Flow Rate (cfs)
Current Zoning (Basic Pond)	23	32.2	18.3
Future Built-out (Basic Pond)	30	48.3	27.7
Future Built-out (Large Pond)	45	48.3	27.7

Proposed Wetpool Geometry

The medium sized pond with a volume of 30 acre-feet, per Table 2, was used to develop pond geometry based on Figure 10.1a and Figure 10.1b of the 2005 Ecology Manual. These figures were marked in red text to show approximate pond geometry and dimensions, see Attachment 1. Based on a minimum depth requirement for the first cell of 4 feet, the proposed water quality design water surface elevation is 17 feet.

Existing Pond Geometry / Available Storage

Attachment 2 presents the stage, storage, and surface area relationships for the existing pond based on City GIS and survey data. The City provided survey data for the existing spillway; this information is included in Attachment 2. Based on the stage versus storage curve, the existing pond with a water surface elevation of 17 provides a storage volume of approximately 75 acre-feet. This demonstrates that the pond has adequate storage capacity for the three scenarios shown in Table 2. At the invert elevation of the existing spillway, the pond is estimated to have a corresponding volume of 180 acre-feet.

The existing pond embankment interior slopes range from 3 feet horizontal to 1 vertical (3H:1V) to 5H:1V. These slopes are within the range recommended by the 2005 Ecology Manual for interior slopes (Volume III, Section 3.2, page 3-21).

Inlet and Outlet Structures

Based on the large size of the existing pond (180 acre-feet available), this evaluation assumes an on-line system is feasible. An on-line system would assume that all flood frequencies are routed through the facility. An off-line pond would provide a high flow bypass for larger flows to be diverted around the facility. The pond system should be further evaluated hydraulically during design to determine the best configuration for flow routing through and/or around the pond.

The 30-inch diameter inlet pipe will require armoring within the pond. The on-line 15-minute inflow rates (Table 2), range from 32.2 to 48.3 cfs. Bentley FlowMaster was used to evaluate the flow velocity of water discharging to the pond. This evaluation assumes gentle pipe slopes ranging from 0.6 to 1.3% and no tail water condition within the pond. Estimated flow velocities are less than 10 feet per second (see Table 3). Typical outlet protection for flow velocities less than 10 feet per second is 24-inch minus riprap.

Flow and culvert calculations are included in Attachments 3A and 3B.

Table 3: Inlet Pipe Flow & Velocity

30" RCP slope = 0.6%		30" RCP slope = 1.3%	
Flow (cfs)	Velocity (cfs)	Flow (cfs)	Velocity (cfs)
32.2	6.7	48.3	9.84

HEC-14 was referenced for determining approximate dimensions of the riprap apron for protecting the pond bottom at the 30-inch pipe outlet. For planning purposes the D_{50} of the riprap was assumed to be 14 inches (assuming $D_{100} = 24$ inches). Attachment 4 presents the approximate dimensions of the rock apron needed for erosion protection at the pond inlet.

The pond outlet shown in Figure 10.1b (Attachment 1) is a manhole structure. The existing pond should be evaluated in conjunction with permit requirements during the design phase to determine if the outfall manhole is appropriate. A weir type structure could also be used as an overflow between the pond and river.

Quantities for Pond Upgrades:

A summary of improvements is provided in the table below. Supporting documentation is provided in Attachment 5.

Item	Quantity
Inlet Protection	
24" minus riprap (heavy loose)	24 CY
Gravel filter	10 CY
First Wetpool Cell	
Excavation (keyway for berm)	790 CY
Excavation (first cell)	3,630 CY
Fill (berm)	1,580 CY
Outlet Structure	
Manhole or weir structure	1 Each
Erosion protection (similar to inlet protection)	1 Each
Slope Improvements	
Assume slopes are in good condition and need some repairs in isolated areas	1,000 CY
Revegetation	
Re-seeding	7 AC
First Cell	98,010 SF (2.25 AC)
Berm (assume 20' wide x 640' long)	12,800 SF (0.3 AC)
Disturbed areas (assume 15% of 30 acre pond)	4.5 AC
Ramp/Access Improvements	2 Each

Other Considerations:

A geotechnical investigation/analysis is recommended to evaluate several items, including but not limited to:

- The condition of the bottom lining system in the existing pond.
- Depth to seasonal high groundwater.
- Slope stability, seepage, embankment, inlet, and outlet condition.

Results:

Model results and calculations are attached.

Applications and Limitations

A wetpond requires a larger area than a biofiltration swale or a sand filter, but it can be integrated to the contours of a site fairly easily. In till soils, the wetpond holds a permanent pool of water that provides an attractive aesthetic feature. In more porous soils, wetponds may still be used, but water seepage from unlined cells could result in a dry pond, particularly in the summer months. Lining the first cell with a low permeability liner is one way to deal with this situation. As long as the first cell retains a

Hydraulic Engineering Circular No. 14, Third Edition

Hydraulic Design of Energy Dissipators for Culverts and Channels

National Highway Institute

$$L_B \text{ min} = 4W_o = 4(6) = 24 \text{ ft, use } L_B = 24 \text{ ft}$$

$$W_B = W_o + 2(L_B/3) = 6 + 2(24/3) = 22 \text{ ft}$$

However, since the trial D_{50} is not available, the next larger riprap size ($D_{50} = 0.83 \text{ ft}$) would be used to line a basin with the given dimensions.

Step 4 (3rd iteration). Determine the basin exit depth, $y_B = y_c$ and exit velocity, $V_B = V_c$.

$$Q^2/g = (A_c)^3/T_c = [y_c(W_B + zy_c)]^3 / (W_B + 2zy_c)$$

$$135^2/32.2 = 566 = [y_c(22 + 2y_c)]^3 / (22 + 4y_c)$$

By trial and success, $y_c = 1.02 \text{ ft}$, $T_c = 26.1 \text{ ft}$, $A_c = 24.5 \text{ ft}^2$

$$V_c = Q/A_c = 135/24.5 = 5.5 \text{ ft/s (acceptable)}$$

Two feasible options have been identified. First, a 2.3-ft-deep, 23-ft-long pool, with an 11.5-ft-apron using $D_{50} = 0.5 \text{ ft}$. Second, a 1.4-ft-deep, 18-ft-long pool, with a 6-ft-apron using $D_{50} = 0.83 \text{ ft}$. The choice between these two options will likely depend on the available space and the cost of riprap.

Step 5. For the design discharge, determine if $TW/y_o \leq 0.75$

$TW/y_o = 2.0/2.7 = 0.74$, which satisfies $TW/y_o \leq 0.75$. No additional riprap needed.

10.2 RIPRAP APRON

The most commonly used device for outlet protection, primarily for culverts 1500 mm (60 in) or smaller, is a riprap apron. An example schematic of an apron taken from the Federal Lands Division of the Federal Highway Administration is shown in Figure 10.4.

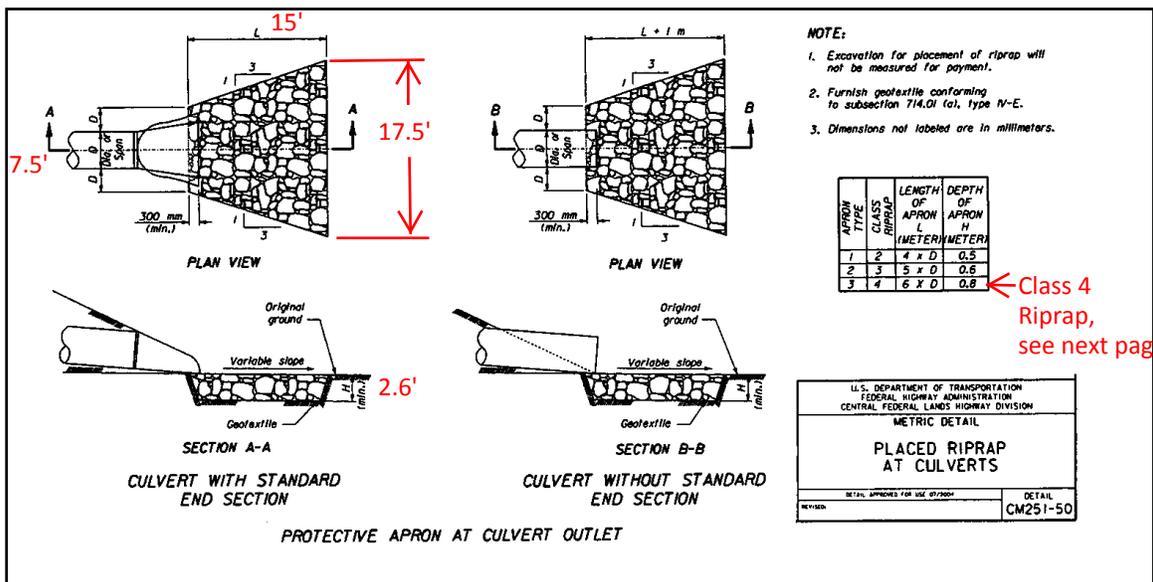

Figure 10.4. Placed Riprap at Culverts (Central Federal Lands Highway Division)

They are constructed of riprap or grouted riprap at a zero grade for a distance that is often related to the outlet pipe diameter. These aprons do not dissipate significant energy except

Table 10.1. Example Riprap Classes and Apron Dimensions

Class	D ₅₀ (mm)	D ₅₀ (in)	Apron Length ¹	Apron Depth
1	125	5	4D	3.5D ₅₀
2	150	6	4D	3.3D ₅₀
3	250	10	5D	2.4D ₅₀
4	350	14	6D	2.2D ₅₀
5	500	20	7D	2.0D ₅₀
6	550	22	8D	2.0D ₅₀

For flows 10 fps or less, typical rock size in industry is 24 inches minus. Assuming D100 is 24" and D50 is 14", use Class 4 Riprap.
Apron Length = 6 x 2.5' = 15'
Apron Depth = 2.2 x 1.17' = 2.6'

¹D is the culvert rise.

The apron dimensions must also be specified. Table 10.1 provides guidance on the apron length and depth. Apron length is given as a function of the culvert rise and the riprap size. Apron depth ranges from 3.5D₅₀ for the smallest riprap to a limit of 2.0D₅₀ for the larger riprap sizes. The final dimension, width, may be determined using the 1:3 flare shown in Figure 10.4 and should conform to the dimensions of the downstream channel. A filter blanket should also be provided as described in HEC 11 (Brown and Clyde, 1989).

For tailwater conditions above the acceptable range for Equation 10.4 (TW > 1.0D), Figure 10.3 should be used to determine the velocity downstream of the culvert. The guidance in Section 10.3 may be used for sizing the riprap. The apron length is determined based on the allowable velocity and the location at which it occurs based on Figure 10.3.

Over their service life, riprap aprons experience a wide variety of flow and tailwater conditions. In addition, the relations summarized in Table 10.1 do not fully account for the many variables in culvert design. To ensure continued satisfactory operation, maintenance personnel should inspect them after major flood events. If repeated severe damage occurs, the location may be a candidate for extending the apron or another type of energy dissipator.

Design Example: Riprap Apron (SI)

Design a riprap apron for the following CMP installation. Available riprap classes are provided in Table 10.1. Given:

$$\begin{aligned} Q &= 2.33 \text{ m}^3/\text{s} \\ D &= 1.5 \text{ m} \\ TW &= 0.5 \text{ m} \end{aligned}$$

Solution

Step 1. Calculate D₅₀ from Equation 10.4. First verify that tailwater is within range.

$$TW/D = 0.5/1.5 = 0.33. \text{ This is less than } 0.4D, \text{ therefore,}$$

$$\text{use } TW = 0.4D = 0.4(1.5) = 0.6 \text{ m}$$

$$D_{50} = 0.2 D \left(\frac{Q}{\sqrt{gD^{2.5}}} \right)^{4/3} \left(\frac{D}{TW} \right) = 0.2 (1.5) \left(\frac{2.33}{\sqrt{9.81(1.5)^{2.5}}} \right)^{4/3} \left(\frac{1.5}{0.6} \right) = 0.13 \text{ m}$$

Step 2. Determine riprap class. From Table 10.1, riprap class 2 (D₅₀ = 0.15 m) is required.
